I always thought it was the other way around, you are actually fooling
it to read maybe a low swr, but in reality, that is all it is doing,
"fooling" it, thus you are still left with an incorrect result.

Wasn't me. I never made any contention that coax length affected SWR.
However, I _do_ contend that coax length makes a difference as to what
point of the standing wave lands on the radio.

Check the 'net for a PA called "the Wobbulator" or "the Warbbolator" or
something like that. It's marketed to volunteer firemen, runs about
$150 including 100W speaker, controls, and mic. Also has a nice siren!

Evidently, there is much dissent over this thought. (As replied by
Troll Exposer)

I see the only use for the CB band as viewed from an Amateur Radio Op ,
is that
most new hams come from these ranks.
You won't get new people into the hobby without a try and buy area.
The band is informal and mostly downright
obscene.....but
occasionally you will find nice QSO going on.
I also agree that most ham QSOs are quite boring.
Many will stay there and die there but many move on and up into the ham
ranks and
also die as technicians without using the HF spectrum and making
international
conversations.
I wonder if moving the Citizens Band to VHF would curb the use of the 11
meter band
by OPs or also the fact that they now currently use adjacent bands for
this
purpose.....below and above the CB band and even into 10 meters.

If the operators of the CB band would contain themselves to the
designated band
area , I would oppose the thought of taking back 11 meters.

I think we Amateurs will need to do something about it although I am not sure if it
would still allow unlicensed operators some area to work to test if Ham radio is
for them.

I would support the move and lets see what happens.

That's what I got. I don't know what anylength got, or why he didn't
show this when I first challenged him. I can only guess it is because
he doesn't know half of what he is talking about.

>Do I win the challenge?

Close. Now prove that "50 ohms is, by definition, resonant"

>Is non-reactive resistance the same as purely resistive impedance?
>Yes a 50 Ohm resistor will yield a SWR of 1:1 with 50 Ohm coax. For an antenna
>to yield a SWR of 1:1 the whole impedance must be transformed up to 50 + j0. You
>can't just disregard the imaginary part of the impedance. Correct is does not
>radiate any power, but it is part of the impedance that can not be ignored.

Basic electronics teaches that resistance is only a component of
(complex) impedance. A resistor has impedance, but for the purposes of
discussing these frequencies, it's reactance is negligible. So in an
earlier post I mentioned that the complex impedance of a resistor is
50 + j0 ohms. The problem with anylength is that he was diverting the
subject from standing waves to defining the differences between an
antenna and a load. An antenna is a load. A resistor is a load. The
transmission line doesn't care if that load is an antenna or a
resistor, because if either one is not matched to the line it will
reflect power just the same.

>What you gave earlier is just the magnitude of the impedance. That is only half
>of the impedance. What about theta = invtan(X/R)? just hoping it goes away?

I was hoping that anylength would prove he actually read a book on the
subject, which he didn't.

>gee 0 + j50 is pure reactance. Let's see what the magnitude is? Yep the square
>root of 50 squared is 50. But I thought that only real power can be radiated by
>real components. Since the impedance is imaginary the power radiated is reactive
>power. Reactive power is radiated as heat if I remember correctly.

I disagree with you there, since there are many non-resonant antennas
that are very reactive. EM radiation is caused (in normal radio comm)
by the current in the radiating element, regardless of whether the
element is reactive or not. This is EM fundamentals.

From your other post:

>*Zsource = 37 + j15 ohms
>*Zload = 37 - j15 ohms
>*
>*Is that an impedance match? Yes. Will it reflect power? No. Is the
>*load resonant? No.
>**************************************
>
>Again I reitterate, a nice conjugate match. good for matching a rf amp. Useless
>for matching an antenna to the coax. Oh buy the way, the load is resonant. Show
>me where the net reactance of a parallel RC and a parallel RL in parallel
>containing reactive components of -j15 and +j15 is not zero. Does that not
>define resonance?

The match is resonant, not the load.

Mr. Pain ï¿½, registered moron, BKA mrpaininhizcoochie@keyclowns.com, while smearing his mother's crotch with the regurgitated jizz he gulped from his brother, uttered the following weak and faggy slams:

>You can't do any better than that Fatboy????? That registered moron
>shit is kinda old and so are the squirrel droppings, but that's cool Im
>not the registered child molester. Do you think you you could get your
>mind off of food long enough to come up with something else Fatass????
>There's a donut in it for you, maybe even some chocolate!!!! I might
>even give you the dried french fries under my seat if your a good
>little fatboy!!!!
>

N8wwm sparklingly replied:
Ya know, it shows your level when you screw with me bout bein fat. And a poor insult it is, too. I am fat, OK I can go on a diet. You, on the other hand, are retarded. What can ya do about that, Bevis?
And no, I do not want to mess with any of your "honeys". Any scagbag who would do you probably contributed to the diseased condition of your mind with some kinda STD. I heard the doctor had to reach through 8 inches of pus and scabs just to deliver your skanky ass.

Re: the squirrel turds and the registered moron lines....
I know it pisses you off, that's why I do it. You wouldn't be crying if it did not.
I, for one, would rather eat a twinkie than a squirrel turd. If you want you can even eat my twinkie.

Back under yer rock, ya fairy.

3397. 4 Sale - Palomar 90A base amp and Courier Centurian SSB

Newsgroup: rec.radio.cb
Date: 2000-12-21 17:33:21 UTC
From: U-L-T-R-A@webtv.net
Message-ID: <17042-3A423EE1-44@storefull-102.iap.bryant.webtv.net>
Source record: 64731

Hi, I have a Palomar 90A base linear and a 23 ch Courier Centurian SSB base station for sale. I got it from a man I did some work for. he had it sitting on his kitchen table and I asked about it and he said he had it back in 80 or 81 and it had only been used for about 6 months. He said his Moonraker beam bit the dust in an ice storm so he just put his radio equipment in the closet and forgot about it LOL. He said he had just gotten it off the closet shelf a little bit earlier and that he was just going to sit it out by the dumpster. Well of course I told him that if he didn't want it i would maybe take it off his hands hehehe.

So anyway I checked it all out and it not only looks like new but works like new too. I got out of CB a few years ago when I got into the internet. I have had a Palomar 90 A and a Courier Centurian before and both are awesome units, anyone that has had either knows what I'm talking about. The 90A is a killer amp and is very under-rated on its power output. It hammers it out there on SSB and even improves the audio quality of any radio.
The Courier is an awesome 23 ch SSB cb base station. It is a big and beautiful radio with an analog clock and 2 meters (one is an swr meter) and has on the air light. It is very broad banded and has a tight receiver and killer noise blanker on SSB. I used a Glen 326-G digital vfo on mine and the way I had it tuned it would cover from 26.500 to 28.000 very smooth. I had it tunned more towards the upper freqs because I talked a lot of sideband. Before I put the Glen on it I used a little 6 postition crystal switch box and it worked awesome like that.
I have had many radios since then but none come close to the quality of receiver of the Centurian with its killer rejection and ears. Rangers and Galaxies and the like are a joke compared to it. It puts out 25 to 30 watts on SSB after just retunning without any component change outs.

Ok I better shut up about my old radio days because Im starting to miss it and may not sell this gear after all LOL.
Well since I came accross it for free I am going to sell them for $100.00 each or best offer. I will ship them COD if you prepay the COD fee (sorry but I've been burned on here once) or let me know how you prefer to do it. Just email me with your offer.....Thanks Doug

Just go to Radio Shack and get yourself the largest speaker that you can fit where ever you're putting your PA. Make sure it a speaker designed for outside use. Then Radio Shack used to sell a little 40 watt audio amp that would be perfect. I did exactly that a few years ago and it was louder than a cops PA

I purchased a Comanche Warrior 10 meter base station as a second radio and I am having trouble finding the frequency expansion modifications for it.

The Defpom modification site has a mod, but it is too vague, as there are no circuit labels on the smt pcb, only chip component values. The mod also seems like it might be mistyped or outdated.

If anyone could provide any concise, current information on the frequency expansion procedure for this unit, or a link to it, I would really appreciate it. Thank You

How much did you drive the 40W amp with? How could you be louder than a
cop?
Most emergency vehicles have 100 or 120W PA systems, here in MA some
state units even have 350 watt rectangular horns...if Rat Shack can
sell me a 40W unit that will outdo those then they've got one happy
customer coming their way...

Yeah, but I figure it this way: if you're serious enough about your
CB hobby then you probably have one of the "export" model radios that
easily produces 13W AM and 35W PEP SSB. From there, a 100W amp
just isn't that big of an improvement.....and anyway, anyone who wants
more power now will want even more later, they can skip a couple steps
right from the start by getting a 300W (or more) to start with.
If 100W is good, 300W is better, every trip of the train.

: <anylength@willdo.com> wrote:
;
; :Now, answer these questions:
: :1) What is the antenna impedance (including imaginary part) when
: :the SWR is 1:1?
:
: The antenna impedance can be any combination within the boundaries of
: the equation
:
: Z = (R&#65533; + X&#65533;)^&#65533;
:
: There is an infinite number of possible combinations of resistance,
: capacitive reactance and inductive reactance which will yield 50 ohms.
: Using an arbitrary value, 22.36 + j44.72 ohms = 50 ohms impedance at

: the antenna. This is Example #2.

Here, you indicated that 22.36 + j44.72 provides an SWR of 1:1.
And you indicated that there are an infinite number of impedances
that yield an SWR of 1:1.
Sorry, Sparky. Once again, you are wrong.

I did not show any calculations because I could tell just by looking at
it that it was not 1:1 as you claimed. If it is not 50 + j0, it is not
1:1. No calculations are necessary.

Since Z does not equal R + X (it equals R + jX), who cares?

(I wrote this part):
> *> No. 50 ohms is 50 + j0 ohms. There is only one combination of R
> *> and X.
> *> If there is a reactive component, it is not 50 ohms.

Yes.

> By that definition there is but only one solution.

Yes, and that IS the definition of 50 ohms.

> Yes there can be an infinite solution to give
> a magnitude of 50 Ohms but only one solution that yields a pure
> resistance.

Who cares about the magnitude of the impedance? It tells you
nothing. It is an incomplete description of the impedance.

I was in there from 2:30 to 3:15 EST. I was making myself heard all over! It was quiet about 3:00 EST because I had the channel pretty much under my control!! I called for you a few times but I didn't hear you come back. Texas, Kansas, Washington State, Idaho, Newfoundland, and others I forgot about were coming back like gangbusters. Try again...

And I did say, "Unit six-nine, Chesapeake Bay!" hehehe.

I don't think I have to figure anything out.

I told you what was wrong with your radio.

If you can't figure out simple troubleshooting and a truth table, fuck off.
You don't need to be putting your hands in that radio.

You already admitted you fucked it up more than when you started.

Their is a reason a REAL technician charges... Because he knows what the
fuck he is doing. Unlike you, stupid.

Congrats. You made the killfile.

Yeah, people really like to be talked to like their idiots... Or better
yet, not talked to
at all, since they don't know as much as you.

That
> is the only thing you can offer is service since technical know how is not
> part of anyones resume at xforce.

Technical Knowhow? For what? A fucking grounded base amplifier?

Geeze... The DC amplifier is finished. You can't get anything else out of
the 2879.

Dave wasn't the first person to do it, nor will he be the last.

> If you disliked daves stuff you would have to dislike the xforce line
since
> we all know why.

Not one person has said that XForce is superior technically. That is
something
that DaveMade keeps pushing.. That the XForce line is going to die, since
nobody
their can technically improve upon it. And your right. The 2879 has been
completely
"exploited".

However, DaveMade (et al) sure does seem to wanna knock down the people with
the exact same product to offer, as well as customer service...

If ya can't expound on the technology, ya gotta offer something, or ya get
left in the dust.

> No I am sorry you have made no point at all Ill make my point again

A. That should be two seperate sentences.

B. Yes, he made a valid point, something everyone else has gotten, but you don't.

People want customer service.

If no
> one can get ahold of davemade why are there so many out on the airwaves.

Because their is a select clientele, as well as a shitload of dealers, and a LOT of people
selling them.

DaveMade peaked when Texas Star was shut down in the 90s, due in some part to
the internet explosion, as well as Dennis O. telling people to buy them because he thought
they where the best at the time.

Nobody has said they are technically inferior to the XForce, Cookie, No Name, etc. brands.. Just
that DaveMade has a bunch of self-serving prick attitude having people working for them... And
your attitude is proving it. Whether or not you work "in the DaveMade" camp, you purport your-
self to in the manner you speak and act, and nobody wants to deal with someone who acts like you.

Why should they? They can have damn near the same product with X-Force, and have someone
on the phone when they need it, as well as a product that is easier to get in the first damn
place.

If X-Force would have been around in the mid 90s, DaveMade wouldn't be NEARLY as
popular as it is today. Thats a fact jack.

> Reread the thread and you will see who replied to what, you blamed operator
> error for most all broken xforce or davemade then you post under another "
> suedo" name

A. You have proof it is him

B. It's spelled psuedo

saying you are just a customer then if this is so why do your
> shorts get all bunched up when someone mentions xforce why i tell you why
> you work for them its just that simple.

No, it is much more complex. You just don't get it.

I am sure old Riley knows all about
> you guys anyhow from what i have read on here . Perhaps You can tell mr
> hollingsworth how service oriented that xforce is when he makes a visit.

And I am sure when they show up at one of the DaveMade camps, you will get
off
scott free, because you can say that you don't sell to "everyone", and you
never answer
the phone.

Get real

Ice, EXACTLY.

But, if you where the new person to CB, would you want to deal with a
company
that wouldn't answer the phone, reply to your emails, and was generally hard
to get
ahold of, or the people who damn near bent over backwards to help you.

That is the WHOLE point people are trying to make here.

Dave is a DC god in the CB community. Nobody is taking that away from him.

His camp just doesn't give a shit about the average customer.

Word is getting around, and with the internet, it is getting around fast.

It is rarely used that is the point. So open it up and loosen the traffic on 11 Meter. Watch the radio development that would occur if it could be offered to the masses and the power levels increased.

Look at the pathetic FRS band. There have been more radios developed in 1 year than 11meter has had in 10.

wrote:

*In article <3a435cc7.4042759@news.gate.net>, jdaggett@gate.net wrote:
*
*> A nine foot vertical over a 8 foot diameter ground field (solid or
*> mesh):
*>
*> 1) if it is a 1/4 lambda will have a radiation impedance of 36.5 + j24.5
*> Ohms.
*
*I don't know why we should care but OK.
****

This was done in response to his hypothetical antenna. I added some basic
conditions to show what antenna impedcance will do when frequency is varied.
Nothing more.

****
*> 6) Now if we let this antenna alone a tried to feed it with 50 Ohm coax
*> what is our SWR? The magnitude of the impedance is roughly 44 Ohms.
*
*The magnitude of the impedance does not determine SWR.
*The impedance determines SWR.
****

Correct my intent here is not to prove that the magnitude but to show that the
magnitude cannot be used.

****
*> That will gives us a close match since 44 is very close to 50.
*
*Is 1.95:1 (as you calculate below) a "very close" match?
*You have just demonstrated the problem with attempting to use
*the magnitude of the impedance to estimate the match.
****
CLose enough to be usable. It is just a matter of choice. I have never been one
to try and achiev the perfect match. 1.5 to 1 is good enoght for me. Maybe you
think that 1.5:1 is a bad match. "very" may have been a poor choice of words to
discribe.

****
*> But that does not satisfy the equation for SWR.
*
*Yes, so why did you use it to estimate a very close match?
****

Interresting as to why have you singled this sentence out of context to post
your question. As for close 2:1 is what I consider close enough to work and
1.95:1 is less than 2:1. Besides 2:1 is closer to being matched than 15:1

****
*> To calculate SWR we first must know the load reflection coefficient.
*
*Now you're cookin'.
*
*> We can do that because we know the load impedance and the characteristic
*> impedacne of the coax. Form the valules given we obtain a reflection
*> coefficient of -.323 at angle of 85.6 degrees.
*
*Hmmm, I get 0.311 at 103 degrees. Why do you specify your magnitude
*as a negative number?
****

Correct I went thru my math again and found two errors. one forgot to reset the
calcualtor back to rectangular mode before entering the denominator's complex
impedance. When I did the math over it does come out to be .311, The angle was
wrong because of a algebra error. Should havenever factored out a -1. Donn't
really know why I did. Maybe due to it being late at night and I was somewhat
tired. But yes the angle is 103.

************************************8
*> For SWR we are only interested in the magnitude of the
*> reflection coefficient, .323.
*
*Absolutely correct.
*
*> The negative sign is not needed for SWR calculation as it tells us
*> the phase of the reflected wave.
*
*Again, correct.
*
*> Now SWR is found by:
*>
*> S = 1 + .323 / 1 - .323 or about 1.95 for a load impedance of 36.5 +
*> j24.5.
*>
*> Now if the frequency were altered such that the imaginary part of the
*> antenna were zero we get reflection coefficients of .156 and a SWR of
*> 1.36.
*
*True, but if the frequency were altered, the real part of the impedance
*would most likely change, too.
****

Yes both change.

****
*> This will be the lowest we can achieve with this example.
*

*Not sure what that means.
*
*> Now one more note of importance. Since we have not accounted for grounds
*> affect on the radiation impedance, this is only but an estimate of SWR.
*> In reality the SWR can be vary greatly depending on ground. Unless you
*> measure ground conductivity...
*
*Why measure ground conductivity? Just measure the damn SWR and you'll
*know what it is! You must be a government employee.
****

Ground will affect the antenna's impedance. No I am not a government employee.

****
*> 7) Now how do I get the SWR at the transmitter to see 1 or 1:1? Well we
*> can adjust the length of the coax until the SWR read 1:1. Yes that will
*> work.
*
*NOT! That will not work.
*Go back and recalculate your reflection coefficient using a different
*length of transmission line. What's that you say? The line length
*was not part of the calculation? That's right!
*The SWR is independent of the line length.
****

SWR at the antenna is not affected by line length. I have never said that it
was. I have seen line length adjusted to where a SWR meter reads 1:1. Now I know
that the impedance looking into the coax is not 50+j0. I can look at a Smith
chart and see that. I just am at lost to expalin it mathematically. I have some
ideas but I need to work thruough them first.

****
*> But remember SWR is 1 + RC over 1 - RC, where RC is the reflection
*> coefficient. The reflection coefficient is the difference over the sum
*> of the characteristic impedance and th eload impedance. Now by adjusting
*> the coax length have we changed any of the two? NO. Thus SWR on the line
*> still remains constant.
*
*I just said that.
*
*> Now there a unique principal that allows the impedance looking into a
*> coax to vary versus length.
*
*I don't know that I'd call it "unique" but yes.
*
*> This impedance also varies with respect to a tangential curve.
*
*Say what?
*
*> One thing about this principal is the load must remain constant for all
*> lengths tried and the characteristic impedance of the line must remain

*> constant. With that we can adjust the length until we get the desired
*> impedance we want looking into th coax with some load on the other end.
*
*Well, you are only going to get certain impedances and none of them will
*be the desired 50 ohms.
****

The magnitude will. That I know. The problem is when the magnitude is 50 Ohms
the angle sure is not zero.

****
*> If we adjust the length until the impedance looking into the coax is
*> 50 Ohms,
*
*Can't be done.
*
*> and place a SWR meter at that point we would get the desired results.
*
*Since varying the length NEVER achieves a 50 ohm input impedance, you
*will NEVER get the desired results.
****

Not a 50 +j0 correct. But say with 36.5+j24.5 Ohm load and a 2.6811 meter length
of 50 Ohm lossless coax, you get 50 -j32.74 looking into the coax toward the
load. Now if the output of the transmitter were say 50+j32.74, then that would
satisfy a conjugate match requiremts. But then the generator's reflection
coefficient is not zero. Thus you now have reflections from the generator back
towards the antenna from the fist wave.

****
*> Again this has done notyhing tothe characteristic impedance of the line
*> or the afffected the impedance of the load.
*
*Yeah, but it has violated the rules of physics.
*Consider this: the SWR measurement is, in essence, a measure of the
*reflected power (just assume for the moment that forward power is
*relatively constant). The impedance seen at the input to the
*transmission line is related to that reflected power. The phase
*of the reflected power changes with transmission line length but
*the magnitude (power) does not.
****

In a lossless line yes. the reflected power is dissapated in the transmitter as
heat if the source refelction coefficient is zero. Otherwise it is reflected
back to the load from the source by the source's reflection coefficient. I know
that SWR is constant on the coax. But consider this:

****
*The ONLY way you will see 50 ohms at the input to the transmission
*line is if there is no reflected power. Since there is reflected
*power coming back down the coax from the antenna, there is NO length
*of coax that will prevent it from showing up at the radio. You will

*NEVER see 50 ohms at the coax input when there is reflected power
*at the antenna. It simply cannot happen.
****

Correct the only way to see 50+j0 is to have no reflected power. I have no problem with that. You will see a complex impedance whose magnitude is 50 Ohms. How can that defy the rules of physics?

****
*> The SWR on th eline is still the same. ALl we have done is changed the
*> impedance looking into the coax to make the transmitter thinks it sees
*> an matched condition.
*
*No it doesn't.
*
*> Now why is this abad method to obtain a match?
*
*Because it doesn't work.
****

If it does not work, then why does the meter reading vary with coax length? Is this whole thing of putting a SWR meter any place other than at the feed point nothing more than a watse of time and effort?

The generator is considered matched to the line when it's output is equal to that of the characteristic impedance of the line. So if this is true, then the significance of the input impdance looking into the line towards the load is meaningless for the transmitter?

james

One of the reasons they *don't* open it up for CB is that much of the spectrum above and below 11 meters isn't even under FCC's jurisdiction. FCC isn't the only agency that has "dibs" on that area. There is another agency, National Telecommunications and Information Agency (NTIA), that governs Federal and military spectrum. True, they don't govern *all* of that area, but enough that it would cause some difficulty in replacing frequencies for the agencies that have assignments there. I do know that some USAF bases use some of these frequencies as low power, point-to-point channels. They are rarely heard because their transmissions are short and to the point-maybe only a word or two. The area that is not used by military is assigned to forestry, forest products, and itinerant business. Again, their use is short, to the point business comms.

I have a whole list of semi-classified frequencies assigned to USAF and MARS due to my affiliation with them (I cannot reveal them even though it *is* possible to find them in the public domain). Many of them ARE near 11 meters. I only post this as information, not to argue the point of CB expansion, to give people the reasons why the "freeband" area is not up for grabs right now. Of course, as future modes, needs, and priorities change, who knows......?

Radio Shack's last top of the line model was a TRC-465 or their
"chrome classic" radio. I thought you had a nice Grant or 148GTL
or maybe a Uniden sideband unit. If you're lucky, you might get
$20.00 a piece for them IF you have the boxes. The Shack is the
last place I'd buy a CB radio from.

I know a place slightly south of Baltimore that will rebuild a non-CS
Chevy alternator to 125 amps. You may want to check with the local
starter and alternator places. Mine holds voltage real well!

*On Thu, 21 Dec 2000 04:37:56 GMT, jdaggett@gate.net wrote:
*
*>22.36 + j44.72 yields a magnitude of the reflection coefficient of about .61.
*>
*>P = [(22.36 + j44.72) - (50 + j0)]/[22.36 + j44.72) + (50 + j0)]
*>
*>believe me this yields about .61
*>
*>Now we calculate SWR.
*>
*>S = (1 + .61) / (1 - .61)
*> = 1.61/.39
*> = 4.13
*>
*>I dare say that will yield a 1:1 SWR. 4.13:1 yes.
*
*That's what I got. I don't know what anylength got, or why he didn't
*show this when I first challenged him. I can only guess it is because
*he doesn't know half of what he is talking about.
*
*>Do I win the challenge?
*
*Close. Now prove that "50 ohms is, by definition, resonant"
****

By 50 Ohms you mean 50+j0? Well any single impedance that has no reactive component is purely resistive. Now a single component that is purely resistive by definition is not resonant. Resonance is a condition where the total reactance of a circuit is zero. This implies that the circuit must have capacitive and inductive elements either in parallel or in series with each other. A circuit element that is purely resistive has niether. Now in the real world a resistor does have reactive components. There will be a point where the resistor is self resonant. At that point the total ractive components that make up a resistor is zero. At that point a resistor is the resonant. The same holds for capacitors and inductors.

****
*>Is non-reactive resistance the same as purely resistive impedance?
*>Yes a 50 Ohm resistor will yield a SWR of 1:1 with 50 Ohm coax. For an antenna
*>to yield a SWR of 1:1 the whole impedance must be transformed up to 50 + j0.
You
*>can't just disregard the imaginary part of the impedance. Correct is does not
*>radiate any power, but it is part of the impedance that can not be ignored.

*
*Basic electronics teaches that resistance is only a component of
*(complex) impedance. A resistor has impedance, but for the purposes of
*discussing these frequencies, it's reactance is negligible. So in an
*earlier post I mentioned that the complex impedance of a resistor is
*50 + j0 ohms. The problem with anylength is that he was diverting the
*subject from standing waves to defining the differences between an
*antenna and a load. An antenna is a load. A resistor is a load. The
*transmission line doesn't care if that load is an antenna or a
*resistor, because if either one is not matched to the line it will
*reflect power just the same.
*
*>What you gave earlier is just the magnitude of the impedance. That is only
half
*>of the impedance. What about theta = invtan(X/R)? just hoping it goes away?
*
*I was hoping that anylength would prove he actually read a book on the
*subject, which he didn't.
*
*>gee 0 + j50 is pure reactance. Let's see what the magnitude is? Yep the square
*>root of 50 squared is 50. But I thought that only real power can be radiated
by
*>real components. Since the impedance is imaginary the power radiated is
reactive
*>power. Reactive power is radiated as heat if I remember correctly.
*
*I disagree with you there, since there are many non-resonant antennas
*that are very reactive. EM radiation is caused (in normal radio comm)
*by the current in the radiating element, regardless of whether the
*element is reactive or not. This is EM fundamentals.
****

I would like to see an antenna that has no real part to it's radiation impedance
and be a radiator? I have never seen a isotropic radiating source. It might
have zero radiation resistance. I wonder, if I had a physically large capacitor
made of two plates, say about 250 pF. How well would it radiate? Let's see, the
electric field will almost all be conatianed between teh two plates. Yes there
will be some fringing effects of the ends. But how far will they extend. Since
they are a small part of the total field and are not fully confined in the
volume between the plates, I guess that would be considered radiating. But since
there is only one field there will be not TEM wave formed so the E field
intensity will deminish quickly as one moves away from the cap. Not very
efficient though.

All antennae have a resistive part. They must.

****
*From your other post:
*
*>*Zsource = 37 + j15 ohms
*>*Zload = 37 - j15 ohms

>
*>*Is that an impedance match? Yes. Will it reflect power? No. Is the
*>*load resonant? No.
*>**************************************
*>
*>Again I reitterate, a nice conjugate match. good for matching a rf amp.
Useless
*>for matching an antenna to the coax. Oh buy the way, the load is resonant.
Show
*>me where the net reactance of a parallel RC and a parallel RL in parallel
*>containing reactive components of -j15 and +j15 is not zero. Does that not
*>define resonance?
*
*The match is resonant, not the load.
*
*Sparky, FLRC
****

Actually the circuit is conjugate matched. If one were to measure the impedance at the junction between the two, you would see 18.5 + j0 Ohms.

Scott,

Thanks for the suggestion. I do know of a local shop that does this.
However, he will tell you upfront that such rebuilds are not always
successful insofar as increasing amperage goes. It may work, it may
not. I am going to try that when mine gives out. I just thot there
might be a supplier of high power alternators somewhere.

Thats real funny nov 17 i recieved a 2x4 xforce amp for a friend who has no internet access we got it from expresselectronics and it was tested side by side on a bench with my davemade m400se which did almost identical watts at 14.5 volts they both peaked around 1250 watts into a dummy load ... Where is the difference?
why thank motorola we are using toshibas

Coax Length Police,

I am glad you are hanging in there. However, its apparent you are wasting
your time. The people you write to already have their minds made up.

To me, its a shame for many reasons that some people on this board won't think, or pick up some text and learn the errors in their ways.

1) This is all stated very clearly in the ARRL Antenna book.

2) I don't like new comers to have to be confused about simple issues...issues that shouldn't even concern anybody! Its very cut and dry.

3) I don't care how you feel about this, but I (a CBer) don't like to look
like an ass here, having know-it-all CBers saying things like different lengths of coax change SWR readings...or you can have the radio "see" a 1:1 match with the right length of coax. Really, it embarrassing to me.

Another thing, any of these jackasses can bring their mobiles, with the coax cut to the ****perfect***** length (whatever that may be). I will pull up next to them in my mobile, with a random length piece of coax...and guess what. Nobody on earth is going to see a damn bit of difference in our signals. No amount of coax pruning is going to provide some kind of advantage.

Now, this is my final offering. Here is a post on rec.radio.amatuer.antenna concerning coax length and SWR. Notice how 98% of the responses in the post clearly state, with a relatively lossless coax line, SWR is unchanged by coax length?

http://x64.deja.com/viewthread.xp?mhitnum=24&AN=463948440.1&frpage=threadmsg_ct.xp&recnum=%3c370C5BE1.F53A7E1@teleport.com%3e%231/2&back=rec.radio.amateur.antenna

Handy Andy, jdaggett, Fred hamburger, tnom@mucks.net and Sparky need to do some serious reading and quite wasting their time defending such beginner mistakes. They have nothing to lose but pride, a small price to pay for knowledge. BTW, for years I defended the 1/2 wavelength mutiple of coax notion, till I was approached by (many) people people who told me I was wrong. After a month of study, I found I out they were right.

Bob.

>and be a radiator?

I don't disagree that an antenna with no real component would not
radiate, but that an antenna with a reactive component does. I refer
to antennas such as those used for AM broadcast and other low
frequency rigs. If it can conduct current, it can radiate, and it need
not resonate to do so.

Absolutely.

>Actually the circuit is conjugate matched. If one were to measure the impedance
>at the junction between the two, you would see 18.5 + j0 Ohms.

But if the voltage/current ratio doesn't change, why half the real part? Shouldn't it be 37 plus the additional real impedance of the matched reactances?

It must have been a good day for DX! I had so many people tell me I sounded like a local. At 3PM, the channel was rather quiet from me talking all over for a half hour. If I heard somebody, they heard me. I talked to some folks 3 or 4 times. It got to the point where I would call a number I heard without saying who I was and they already knew it was their turn to talk to me.

My rebuilt Chevy alternator was doing it's thing. You'll have to check out the regular 40 in the afternoon. I don't use/have any extras on my regular radios. Just a TRC-451 in the big car and a PC-122 with a two-banger Star in my 4x4. No Boomers, DaveMades or XForces. Just clean running Stars. I don't even use a power mike anymore. Don't need to. Crisp and clean. Keeps N8 happy <: (After all, I'm an illegal using an export radio on extra channels, right?) hehehe...

Shut up, Doug. Keep on worshipping the ground I walk on!
(And call me more names. I like that!!!)

Let me help all of you that don't know?
When i had left the "Dave Made Camp"
I really did't change that match on the inside of the amp!

I made the case different so if you had to work on the amp you could do it with out digging into a square hole!

I put more fan's on it.
And more heatsink under it.
Now you can go out and talk on it somewhat longer in "DX"

If i could take anything back i would take what i had took to Chicago and gave away!

I'm really sorry that i started the X-Force line and it got away from me.
But there is nothing that i can do about that now!!

So to answer you all Yes Dave is the man! But he is no longer making the dc amps!

So if you want a good COPY of his work you can get one at "DaveMade NC."

Or if you don't like the color of the "DaveMade" i guess you can get a X-Force from "Steve"!!

It's my bad so i really don't know why you all are getting your panties in a bunch!

Not too long ago i had talk to "Dave" on the phone and he did't even make a big deal over it so you all tell me why are you guy's???

Yes i did work for Dave.
And i did my job and then some...
And i really did't need to start a line of amp's But he hade told me that he is getting out of it....

So "151" was bugging me to do this and i did.
And i'm sorry i did!

I'll give it too Carl i did get him to do it the way that works the best!!!
And he keeps up with the service end of it??

Maybe someday Carl will see what i gave him and understand what he is setting on!

Until then ??????????????????

YES I'M "MR.123ILL."

After 5 years of college and 15 more in the field of electronics
engineering, I have never held any other position than to say what I
have said countless times in this thread. I'll repeat it once more
because you, like some others, obviously didn't read it the first
umpteen times:

If the antenna, transmission line, and radio are properly matched, the
length of the coax doesn't matter (except, of course, for attenuation
per unit length). But if there are standing waves on the line,
regardless of what some of these cheap SWR meters say, there is a
possibility that the standing wave can damage the radio. I know that
happens because I have seen it literally hundreds of times.

Now, for some "serious reading", try going back through the posts and
read what the others have really said, instead of relying on
anylength's I-said-it-so-it-must-be-true school of thought.

Now all you "HAM" super stars Don't want to brake any "FCC" laws now do ya?????

Yes you can take that 35 watt ssb and drive it into two 2879's
Or you can drive it into four of them..

It look's like the man had asked if he couldd get a clean 100 watt amp not a CB "Brake 19 radio check" Good Buddy!!!!

And if you are going it use it on ssb i would get a class AB amp and not a class C amp..
It will work mutch better for you..

Good luck happy DX to ya..

I'm looking for a schematic for a Maverick 250. I need to figure out how to hook the meters back up on the front panel. The lower milliammeter is still in place, but whatever was in the uper opening is long gone. If anyone knows what belongs in that opening and how to hook it up, I'd appreeciate it. Thanks!

Hey Tim,

I didn't say locked down, I said pretty much under my control.
I kept talking and people kept coming back. I probably could
have kept on going and going and going but I had other things
to do. Besides, I had already talked to just about everyone
by then. It was my 45 minutes. I won't say fame...

"www.kp82.com" wrote:
>
> locked down the whole channel wih a 667v?

It runs real good. Besides, who needs more then that anyway?
If your antenna installation is top notch you don't need it on 11 meters.

If there are any local hams in the area that would like to try 10 meters
from my mobile, send me an email. I can come up with a proper radio for
that. I would just need proof of a proper class of ticket. NW Balto.
My SWR should be low enough at 28.4. I haven't checked it there though.

(Come on Doug, say something. I know it's killing you :) hehehe

Hello Scott: Great link here. I saved this one.

Someone has re-drawn this diagram at CB Tricks and did a good job. I wonder is there is a simple program that will let you do this?

Jay in the Great Mojave Desert, we got Rock n Roll, Country & Western, and ah new Juke Box in the "Dew Drop on Inn" in down town Mojave. Tuesday is ladies night. And ya got the hole Mojave Desert out back ta park in.

Interesting you brought that up Cityslicker...as I was kinda thinkin' the same thing. I know I would never buy from an unknown, but there are exceptions to that as well. Folks here on the ng, the ones I am familar with, even though I don't know them personally, I would trust. But I have always wondered about the folks who post stuff and no one has ever heard of them before or seen a post by them. I was interested in an item here around last Christmas someone was selling, and I did a super indepth search and that email name and addy was nowhere to be found. That was a big enough flag for me.

Rolled into an auto parts store in Massachusetts yesterday, saw the most interesting mobile setup I ever could imagine. This guy had a red mid-1990s Chevy Blazer with a large black metal box (about 12x10x4 inches) sitting in the rear center of the roof, just above the rear wing. Attached to the box at about a 60 degree angle to the road was an Antron A99 with a 102" stainless whip replacing the top section. There were several hose clamps with rubber washers in them around the Antron that lead to guy wires that were secured to eye bolts drilled into the vehicle's roof.
I had to speak to the person who owned this, mainly to find out his handle, what the black box was, and if this was his regular setup. Well it was his wife's turn to drive that day, she was clueless about CB but said the box was an electromagnet that was so strong they couldn't use the vehicle's audio system when it was installed. She said her husband built it himself and does indeed drive around "about half the time" with the Antron on the roof, otherwise he just has a 102" whip.
I was just there for a minute and the woman was waiting for something so she couldn't show me the radio, but a quick peek in the cab only revealed a red Road Devil leading to the bottom of the center console.

Just thought you would be interested...

Greetings!

Naahh...since you've brought my name up - I'll resolve my issues.

I don't ever remember even disagreeing with anyone until the fat from anydildowilldo started the foray.

You, and all the rest of the Koaxial Keystone Kops Kopys need to double check their work and RE-READ the posts before inflammatory remarks begin.

All you've done is shown that you, and your crew, are asses. Nice teamwork, but all it's done is made a big mess - there are more questions now, about your methods, than real answers. The Koaxial Kops could have made a lot more sense if they've bothered to explain versus exclaim. That, in it's own light, makes Koaxial Kops, the losers.

I still have my original post to the ORIGNIAL person [Andrew] and the questions that came up.

You guys simply flew off the handle right away - faster than I could even get the mail. You guys did a nice blow job - setup and tear down - got back on that some ol'd train just before it left the station.

<toot-toot>

Thank you for dragging your buttocks back into the bar, you can clean up the mess. You can also explain the scuff marks on your shorts to the old timers that run 80 meters. I'm sure they'd like to hear your physics of the problem just as much as the swill you spew.

It hasn't changed my opinion of any of these Koaxial Kops - in fact it's confirmed it.

BTW - my coaxial line to the CB is 2 feet 6 and 3/4 inches...no, it's not 18 feet even though the Manufacturer recommended that I do so...

LOL!

Flame Away!

Source record: 64885

Greetings!

I've checked in getting a replacement for the one in the Tracker I have. I have the 95 amp alternator. This is also on a vehicle that has air conditioning [Soft-top? With A/C? Yeah it sux, but they don't make these any other way - it's all standard now. Only one size of serpentine belt is available for the 2.0 L4 engines the Tracker uses.]

I was asking about replacing the A/C unit in the vehicle, with another alternator - brackets for each are a different bolt pattern. Figures!

There are fewer options for non-standardized GM line vehicles. Suzuki would have to be the ones I contact and the likelyhood of getting parts for the original to upgrade yet keep the OEM - is pretty remote.

[You can thank the GEO concept for that mess]

I don't know of your situation, except for it's a Chevy. But, this is what I've run across while asking questions at the dealships and two custom shops. All said they could do it, but not one gave me a real price - even when I offered to pay up front.

Just so you know, you might want to upgrade the wiring harness yourself if you get involved with it. That alone can cost some big $$$ if you let a shop try and do it. The more you can do on your own - the cheaper it is. GAWD, a new Main Buss block upgrade may be needed, and you might want to check for availability.

Some buss blocks have internal fusible links that only take so many amps before they quit, even though the fuse you replaced to a higher amp rating so you could use the alternator to charge the system should protect the system. [Mine has a rating of 120 amps - in case the battery + cable went to ground or a goofy starter, [AFAIK] even with a fuse of 90 amps in the buss block.]

Custom? Never went past that offer. Doing up brackets - I know of a few people that visit this N.G. from time to time that might be able to direct you to someone that does make a bracket that will hold a different type of alternator if your idea doesn't pan out. Dimensioning, though, might require you to drive it there.

Rebuilding an alternator and changing the diodes and or stator/rotor windings is pretty easy. Getting the beefier OEM parts, you might need to go into "salvage yards" to locate what you want, let alone save some money at doing it yourself.

Just wanted to let you know that I too, have been looking...;-)

I guess I'll have to ask you to repeat your challenge, I
seem to have had a 'senior moment', can't rememebr which/what
it was.
As to experience, what would constitute proof for you? How
about an old CB call (KQV6070), would that do it? Or just what
would be 'good enough' proof for you?
'Doc

For a little bit more you could have bought a Jeep. I looked at the Tracker and now I'm glad I went Jeep. How much clearance do you have under a Tracker? Do you have 235/75R15 tires on it yet? I got my BFG AT K/O's a month before the Exploder thing hit and now you can't find a 235/75R15 anywhere in stock. I put the old P205/75R15 on my big Chevy.

Now, if we could only get some snow.

I sent him an e-mail about the amp. He is from N. minnesota somewhere he said.
Thats all I know. Way northern.

Later
oneqck76ta@aol.com
http://members.aol.com/oneqck76ta

You've got "459" out of Minneapolis Minnesota and I'm reading the mail

You can get a serpintine belt in any length you need. I would replace the factory alternator with whatever you want (you must be crafty to do this). I would feed the radio equipment off of upgraded wire that feeds its own system or battery. Leave the factory wire alone and just run run the vehicle on it like it was designed. I know for a fact I could mount a large ford case alt on one of those vehicles. It just takes a creative mind and the right tools.

Hmm . . . isn't that how I responded to your last post?

>Also, its true...SWR does change with line length. Its value is highest at the
>antenna feedpoint and goes down as you move down
>the coax towards the load....due to feedline lose. Nobody here mentioned that.

Because that is not quite right.

If the load impedance is greater than the line, then the incident and
reflected signal voltages are in phase, the signal currents are out of
phase, and the standing wave has it's maximum voltage and minimum
current at the point of reflection. Conversely, when the load is less
than the line the signal currents will be in phase and the voltages
out of phase, and the standing wave has it's maximum current and
minimum voltage at the reflection point.

So, when VL > Vo, the voltage on the standing wave peaks every
full-wave from the reflection point. It's minimum voltage is seen 1/2
wave from the reflection point, and every full-wave thereafter. When
VL < Vo, the _current_ on the standing wave peaks every full-wave,
and the minimum current is found at 1/2 wave and every full-wave
thereafter.

The result is that, starting at approx 1/4 wave and continuing every
half-wave afterwards, there is a point where the voltage and current
ratio equals the impedance of the line. At this point the standing
wave is indistiguishable from the signal, since it has the same
impedace as the signal.

Given: a coax, 50 + j0, at 27MHz, and V = 0.66. A 1/4 wavelength of
that line will be approx. 6 feet. Another half-wavelength, 12 feet,
gives the infamous value of 18 feet. At both those points, and every
12 feet afterwards, the standing wave will not be detected. The SWR is

not changed, nor will the standing wave disappear.

So why do some meters care and others don't? Because some are cheap, some only measure DC potentials on the line, etc. If you want an accurate measure of your standing wave, regardless of coax length, measure it at the antenna feedpoint. If you want to eliminate standing waves, match your antenna to the coax.

Most textbooks provide a nice little graphic to help the reader visualize just what I have explained here, so if my explanation was inadequate, read a book.

>With 18 feet of coax, you wouldn't hardly see any change in SWR.
>
>I am still waiting to hear what (wave) length of 50 ohm coax I need to achieve a
>1:1 match at the radio when the antennas feedpoint impedance is 37 + j0 Ohms.
>Anyone who claims you
>can adjust the SWR by changing length should be to answer this simple, unanswered
>question.

I do not claim that, so look for an answer for that somewhere else. I am still waiting for a credible source that supports the ridiculous claim that "50 ohms, by definition, is resonant".

Greetings!

Hi Sparky.

You may not know who I am, but I wanted to stop by and offer some tips that might help you understand what they are not wanting you to explain. It's why I get flamed for this too...

One thing that is not mentioned in these posts, is dealing with a known impedance of an antenna over a ground system.

If, say, you were installing an antenna [simple 1/4 wave no special frequency] and you had problems with the antenna, that you know would be resonate at another location using a known ground image area, this antenna you're testing offers a different impedance at the current location - it's not resonate. The antenna shows a different impedance, no mater what - the coax is merely reflecting this information at random lengths. Using a special length, we DO cancel out unwanted reactance [and is why they simply avoided the [25ohm - 5j or - j5] equation - you can get an antenna to show lower SWR when the reactive component is a higher value.

I had to laugh at their antics. They were funny.

What could have cornered them, and what was eventually being discussed but was later avoided [that was the hint] was the coaxial dipole and how they wanted to know about radiating coax.

Thats why I posted conjugate match. They can't get past the fact that the antenna is no longer "the antenna" - both the coax and the antenna are now a single unit. And depeding on how the coax is used, can be the "shorting stub" [open end] or the antenna itself can be the "tuning stub" used with this given length of coax.

I hope I'm correct in the above. I've cornered them before on it. Look at how my mention of it was treated later in these threads.

This is why I was treated the way I was - it didn't dawn on me until later on as these messages were flying about.

I hope this helps you, and I'm simply letting you know that you are a good source of information about antennas. I'm impressed with not only how you conducted yourself, but your knowledge. If you have a web page or two, I would like to link my pages about CB radio installations to yours to help provide more information.

Would you be interested?

Thank you!

I hear ya Toll. I do understand! I guess if I was a newbie and I really wanted
an amp I would prefer to spend my money where they cater to me as much as
possible. Is that what is happeneing at XForce?
Alot of guys here are so new and dont even realize that it was difficult to get
amps from certain builders. If they didn't know you or at least knew a friend
of yours very well you would NEVER get an amp. Back in the days we knew this
was illegal.
Now as far as the time when dave was really hot well, I tend to disagree with
ya. It may very well have been in the mid 90's but I remember being with dave
myself in the mid 80's (when I first got a davemade) and he was making them
himself then. matter of fact almost all of my davemade amps were built by dave
himself in the 80's. I do have a couple that were built by Concrete Man! In the
middle to late 80's dave had a very good following but as was said before it
was still to a select few, for good reasons, and before this internet stuff,
you really had to know someone to get a good amp from somebody. Of course you
could always find a way to get a Texas Star, but back then all the big boys had
at least their own personal technician. Mine was dave.
Happy Holidays to All!!!
Oh do me a favor tell Shadow that I did appreciate her putting my own words on
her web site "The definition of the Superbowl" but, tell her to please give me

credit for coming up with the words. LOL!!!!!

I agree. Some of arguments here are because people are not clearly stating under what conditions their premises are under. Also, you need to read and think about what other people say before responding. For instance, I saw an argument between Coaxlength and somebody else about 50 + j0 defining resonance. It was clear everybody knew an antenna with a complex impedance of Anyvalue + j0 equals a resonant antenna. Fine.

Also, its true...SWR does change with line length. Its value is highest at the antenna feedpoint and goes down as you move down
the coax towards the load....due to feedline lose. Nobody here mentioned that. With 18 feet of coax, you wouldn't hardly see any change in SWR.

I am still waiting to hear what (wave) length of 50 ohm coax I need to achieve a 1:1 match at the radio when the antennas feedpoint impedance is 37 + j0 Ohms. Anyone who claims you
can adjust the SWR by changing length should be to answer this simple, unanswered question.

Bob.

wrote:

>One thing that is not mentioned in these posts, is dealing with a
>known impedance of an antenna over a ground system.

Well, one thing that I have _never_ seen is a 1/4 wave vertical that measured at the ideal impedance of 36.5 ohms. Or 50 + j0, for that matter. I very rarely see an antenna that isn't reactive to some degree. There are just too many variables to make the definitive claim that any given antenna "must" behave this way or that way.

>snip>Using a special length, we DO cancel out unwanted
>reactance [and is why they simply avoided the [25ohm - 5j or - j5]
>equation - you can get an antenna to show lower SWR when the reactive
>component is a higher value.

The reality is that sometimes even just moving the coax can change the SWR, possibly due to radiation being absorbed by the shield, or even proximity to a ferrous surface. You just can't tell until you get out there and do it.

>I had to laugh at their antics. They were funny.

There are more laughs to come, I'm sure.

>What could have cornered them, and what was eventually being discussed
>but was later avoided [that was the hint] was the coaxial dipole and
>how they wanted to know about radiating coax.

They would have just denied it. No point.

>Thats why I posted conjugate match. They can't get past the fact that
>the antenna is no longer "the antenna" - both the coax and the antenna
>are now a single unit. And depeding on how the coax is used, can be
>the "shorting stub" [open end] or the antenna itself can be the
>"tuning stub" used with this given length of coax.

The shield can indeed radiate when, as you say, it becomes part of the antenna system. This is not always desired or forseen, but it happens. And here's another one for the notebook: When there is RF on the shield, and when that RF is choked short of a multiple of a 1/4 wave from the antenna, you will get harmonics. Sometimes the choke doesn't have do be much, such as close proximity to ferrous materials, or just a kink in the coax. That's why it is good practice to wind excess coax in a figure-8, not a coil.

>This is why I was treated the way I was - it didn't dawn on me until
>later on as these messages were flying about.

They just enjoy pushing people's buttons. They don't care about who's right or wrong, but just that they get their rocks off. So if that is the only way they can communicate, use it to your advantage.

>I hope this helps you, and I'm simply letting you know that you are a
>good source of information about antennas. I'm impressed with not only
>how you conducted yourself, but your knowledge. If you have a web page
>or two, I would like to link my pages about CB radio installations to
>yours to help provide more information.
>
>Would you be interested?

I have a web page, but it has little if nothing to do with CB radio. It deals more with my dabbling in that lowfer stuff, 160 - 190 KHz. It's more of a challenge to get a clean signal out with just one watt and a non-resonant antenna. It's a band for people that know what they are talking about, not for Koaxial Keystone Kops.

I still don't understand why is people having a prob. getting DaveMade amp's

DaveMade "NC" is selling the hell out of them.
So you all should not have any prob. getting one these day's

Shit if you need a repair i'll do that..

Later.....MR.123ILL.

Especially wanting a Money order only. 75.00 was awful cheap cheap enough that a homeboy should of snatched it up.

C.O.D. or nothing. Box of rocks is a stronger mail fraud case than a money order and a no show. For what its worth 75.oo isn't enough to pursue and isn't enough to be a felony. So a person can collect many 75.00 Money orders with out anyone having much recourse.

Buyer beware!!!

3560. Christmas Joke.

Newsgroup: rec.radio.cb
Date: 2000-12-23 01:29:00 UTC
From: scsiudma@aol.com
Message-ID: <20001222202900.13767.00003210@ng-mk1.aol.com>
Source record: 64944

A man and wife wake up one morning shortly before Christmas. The woman says "Wow! I just had the most incredible dream. I dreamt of a huge christmas tree, but instead of the usual decorations, it was all hung with penises. Big penises, small penises, pink penises, black penises... but right on top was the most perfect penis I have ever seen!"
"Let me guess," Says the husband, "That penis on top was mine, right?"
"No, it wasn't. I'm not sure whose it was, but it sure wasn't yours!"
"Well, I had an incredible dream last night, too." Said the husband. "I dreamt of a huge Christmas tree as well, but instead of the usual decorations, it was covered in pussies! Big pussies, small pussies, pink pussies, Asian pussies, red pussies... but on top was the most perfect pussy I have ever seen!"
"And that pussy was mine, right?" Asked the wife
"No, yours was holding up the tree!"

Bob,
As you know, you won't get an answer. At best, you'll
be ignored.
You know, if someone would package a length of 50 ohm
coax that would 'match' the 'normal' 1/4 wave antenna's
impedance to 50 - 0j, they could make a fortune! I wonder
why no one's done that...
'Doc

99 has large meter, which I like,and the controls are a bit easier, the 88 has a series of buttons which can be tough in mobile use until you get used to them, 99 has a couple of extra "sound effects" i.e.: a "robot" distortion and a "voice change" which deepens or raises the pitch of your voice. Both of these are about as useful as tits on a boar. The 88 is very similar to the 148DX and a few others, and I believe shares a board with them. I have had a couple of both and like the 99, they seem to be pretty reliable. It depends on what you plan on using the rig for. If SSB is your thing, save yourself some aggravation and money and buy a used 2510 or 2950, if it's a base application for a few bucks more, usually around 350-450 you can fine a nice "real" HF rig like a 140, 430 Kenwood, 720a Icom, 474, 757 Yaesu, etc.

If you want a big loud AM rig with echo and freq's, and SSB doesn'tmatter much, try a 66 or a Connex 3300.

: You have narrowed the universe to a specific set of conditions which
: has no application in the real world. A million CBers have
: changed the length of their coax and observed the SWR change. Why?

Let us modify this to make that last statement correct. "Many CBers have changed the length of their coax and observed an apparent SWR change."

Note the "apparent".

Now, here is a quiz for you. A good RF meter (such as a Bird) uses a section of transmission line to tap off the voltages/currents necessary to measure the power on the coax. That line section is 50 ohms.

Tell me what happens when the input impedance of the coax at the output of the meter is not 50 ohms. Is it possible that, due to this mismatch, that some of the reflected power is reflected back towards the antenna, rather than being measured by the meter?

What does this do, in an SWR meter, to the indicated SWR?

Note that we are talking about measured SWR here, not actual SWR on the coax between the meter and the antenna.

Another little quiz.

Place your SWR meter at the antenna. Let us assume that there is a 2:1 indicated SWR.

Now, change the length of the coax between the transmitter and the SWR meter.

Does the SWR meter reading at the antenna change? If so, why? If it doesn't, why not?

No, it cannot.

When the eclipse happens depends on where you live. On the West coast of
the US, it is at maximum at sunrise.

At best, the coverage is 60% - e.g. only a partial eclipse.

BUSH SEEKS TO ENJOIN SANTA FROM CHECKING LIST TWICE
Lack of Standards Decried

Austin, TX (Dec. 21)--Attorneys for President-Elect George W. Bush filed suit in federal court today, seeking to prevent Santa Claus from making his list and then checking it twice. The complaint seeks an immediate injunction against the beloved Christmas icon, asking the court to effectively ban his traditional practice of checking the list of good boys and girls one additional time before packing his sleigh.

The suit filed in Federal District Court in Austin, asks a federal judge to "hereby order Mr. Claus to cease and desist all repetitive and duplicative list-checking activity, and certify the original list as submitted without amendment, alteration, deletion, or other unnecessary modification."

"There are no standards for deciding who is naughty, and who is nice. It's totally arbitrary and capricious. How many more times does he need to check? This checking, checking and re-checking over and over again must stop now," said former Secretary James Baker.

Baker further claimed that unnamed GOP observers witnessed an elf remove all boys named Justin from the 'nice' list, filing them under 'naughty instead because "everyone knows all boys named Justin are brats."

Bush cited the potential for unauthorized list tampering, blasted what he called the "crazy, crazy mess up there at the North Pole." "Their security is really awful, really bad," said Bush. "My mother just walked right in, told 'em she was Mrs. Claus. They didn't check her ID or nothing."

Meanwhile, Dick Cheney, issued a direct plea to St. Nick himself. "Mr. Claus, I call on you to do the honorable thing, and quit checking your list. The children of the world have had enough. They demand closure now," Cheney said, adding that his granddaughter has already selected a name for the pony she's asked for.

The Rev. Jesse Jackson was quick to respond to the latest development with plans to lead his protesters from Florida to the North Pole via dogsled. The "Rainbow Mush for Justice" is scheduled to leave Friday. "We need red suits and sleighs, not law suits and delays," Jackson said.

Santa Claus could not be reached for comment, but a spokeself said he was "deeply distressed" by news of the pending legal action against him. "He's losing weight, and he hasn't said 'Ho Ho Ho' for days," said the spokeself. Experts feel that future Christmas celebrations could be placed in jeopardy. Santa is apparantly not qualified for any other job, and no one is sure what he might do if he loses this battle.

I want to announce the new Forum Database where you can buy and sell just about anything you like, from CB, Ham, Amplifiers and so on.

The neat thing about this Forum Database is that if you have a website, you can also link up to the same forums and have a web-interlinked forum that can be endless. All subscribers (which is free) can link up to the same forums and reach and unlimited amount of people.

Come on by and check it out at "chargerscastle.com" and take a look at what I am talking about. Once you hit Chargers Castle, click on "The MarketPlace".

I hope you all have a Very Merry Christmas and a Happy New Year!

Charger

Hey Sparky, as you have just proven, credentials mean nothing. I don't
rest on my laurels.

By virtue of the fact that you call it "electronics" engineering,
I'm guessing that you have something less than a Bachelors degree --
probably some sort of associates or technical degree. I'm guessing 5
years of part-time schooling. Let me know if my guess is right.
All good and accredited universities that I am familiar with call
their Bachelors and graduate degrees "electrical" engineering.
And, if you had a bachelor's degree, you probably would have said so.

And despite your vast background, you still think that impedance
is defined as:
Z = (R² + X²)^²

and you think:
22.36 + j44.72 ohms = 50 ohms impedance

Contact your school; they need to recall your diploma. You're
giving them a bad reputation.

Sparky. We are getting to the bottom of your misunderstanding.
The more you talk, the more I see the source of your misunderstanding.

If the "voltage to current" ratio matched the impedance of the line at
any point...it would match it at every point. The amplitude of the
voltage
and current would also remain constant. This means your antenna is
matched to the characteristic impedance of the line, 50 + j0 Ohms in
this case.

To quote the ARRL Antenna Book, 18th edition, page 24-8.

"The mismatch between the load and line is responsible for the
variations in amplitude which, because of their stationary, wave-like
appearance, are called standing waves."

> So why do some meters care and others don't? Because some are cheap,
> some only measure DC potentials on the line, etc. If you want an

> measure it at the antenna feedpoint. If you want to eliminate standing
> waves, match your antenna to the coax.

Regardless of the error in the measurement of standing-waves, the ratio is constant - no matter what the line length. So why mention coax length at all? Use a Bird directional watt meter, place it where you want
to on the line, read forward power, read reflected power...calculate SWR.
Simple as that. Results super accurate under 100Mhz....

I don't know when I will be on again so, Merry Christmas to everybody reading this.

Bob.

What if the load impedance is 40 - j30 ohms? Is it greater or less
than the line impedance?

> So, when VL > Vo, the voltage on the standing wave peaks every
> full-wave from the reflection point.

No, every half wave.

> It's minimum voltage is seen 1/2 wave from the reflection point,
> and every full-wave thereafter.

No, every odd multiple of 1/4 wave.

> When
> VL < Vo, the _current_ on the standing wave peaks every full-wave,

No, every 1/2 wave.

> and the minimum current is found at 1/2 wave and every full-wave
> thereafter.

No, every odd multiple of 1/4 wave.

> The result is that, starting at approx 1/4 wave and continuing every

> wave is indistiguishable from the signal, since it has the same
> impedace as the signal.

Indistinguishable with a common voltmeter and ammeter but easily
detected with a cheap SWR meter which utilizes directional couplers.
Furthermore, the voltage and current will not have the proper phase
relationship for a 1:1 SWR -- this can be detected.

> Given: a coax, 50 + j0, at 27MHz, and V = 0.66. A 1/4 wavelength of
> that line will be approx. 6 feet. Another half-wavelength, 12 feet,
> gives the infamous value of 18 feet. At both those points, and every
> 12 feet afterwards, the standing wave will not be detected. The SWR is
> not changed, nor will the standing wave disappear.

First of all, an SWR meter will STILL properly detect the correct SWR.

Secondly, this statement ONLY holds when the load impedance has no
imaginary component (j). A load impedance with an imaginary component
will make the peaks and nulls of the standing waves occur at different
points along the coax. Since the load impedance is generally not known,
there is no way to say what reading will be yielded at that "infamous
value of 18 feet."

All this conjecture is essentially meaningless and valueless.

> So why do some meters care and others don't? Because some are cheap,
> some only measure DC potentials on the line, etc. If you want an
> accurate measure of your standing wave, regardless of coax length,
> measure it at the antenna feedpoint. If you want to eliminate standing
> waves, match your antenna to the coax.

Even the cheapest SWR meters don't care. Furthermore, measuring SWR
at the antenna feedpoint is not only unnecessary, it is often
impractical.

> Most textbooks provide a nice little graphic to help the reader
> visualize just what I have explained here, so if my explanation was

The car I had at the time was a 78 Thunderbird which had ALLOT of
space directly behind the grill. I was able to fit a 8 x 4 inch horn
style speaker in that area. The PA circuit on a standard cb radio is 4
watts so that's what I was driving that Rat Shack amp with. Yes, it
was VERY LOUD. Loud enough that at highway speeds people in the car in
front could hear me just fine. Worked better than the dam horn!

>I am considering buying a galaxy radio and would like to know the >difference between the 88 and the 99. Also would like opinions on >which radio to buy, a galaxy or another....

To get a feature comparison, just go to the Galaxy web site at http://www.galaxyradios.com/featurechart.html
In my opinion, the real difference between the 88 and 99 is the way the look and their features. Performance wise, I feel their the same. Of course you'll get some people saying their 99 is better than the 88 and you'll get people saying their 88 is better. Both radios can be made to be just as loud as the other.
I've had both radios and the one I liked the most was the 99 because it has the really nice BIG meter.
I'm selling my 99 along with a D-104 mic. I got it up for auction at Yahoo Auctions and I'm asking $250, which is about $100 bucks less than brand new, plus it's been professionally modded and it work great. The Auction is ending soon, and at this time the bids are at $220. If no one bids at least $250, I'm going to relist it. The auction is at http://page.auctions.yahoo.com/auction/47113254

>and current would also remain constant.

That's just plain ridiculous. If your argument were true there would be no standing waves. Nice idea, but no basis in reality.

When the voltages from two signals are in phase, they add to a value greater than both the originals. If the voltage from the incident signal is 50V and the reflected signal is 25V, the voltage of the standing wave, at that point, will be 75V. At that same point the current from the incident signal is out of phase with the current from the reflected signal. Keeping with a 50 ohm line, the current of the incident signal is 1A, and the reflected signal is 0.5A. The difference is 0.5A. Now you have a standing wave of 75V and 0.5A, therefore the impedance _at that point_ is 150 ohms.

Moving 1/4 wave down the coax the phases are reversed. The voltage of the standing wave will be 50 - 25 = 25V, the current will be 1 + 0.5 = 1.5A, so the impedance of the standing wave _at that point_ will be 25V / 1.5A = 16.7 ohms.

This is the application of grade-school math to basic phase interaction. The only thing I misunderstood was your level of comprehension.

they are both extremly low qaulity for the price they cost. they come out of tune from the factory and often with bad solder joints. dont even think about bying one if you use ssb. if you just talk on one channel all day on am then it will be just fine as long as there no strong stations in your area because there recieve really sucks too.

OK... Lets quickly look at the FRS band you cite as a glowing example......

All those new radio 'developments' you claim for FRS are nothing more than
re-packaging of pre-existing technology from the business/ham bands in the
same frequency range. I might add that the FRS radios operate at FAR lower
power levels than their business band 'cousins'.

I work for an ISP, i can say first hand that this virus IS real. From what ive seen it comes as an e-mail, ususally titled "Show white and the 7 dwarves..." I have seen a few variants of the virus, it seems to mutate itself into different viruses but i dont know that for sure. I think the only way you can be infected is if you OPEN the attatchment. ive seen the attatchments come in a few different flavors, one was an EXE another was an SCR.

Good Luck.

Sorry I was late getting back. I have come to the conclusion that this newsgroup is extremely boring reading. The majority of posts feature brain-challenged low-lifes bragging "my amp is bigger than yours" and other such silly feuds. However, the brazen thuggery and underworld aspects displayed by those in the illegal amp business intrigues me greatly.

Reading through some of the "Is XForce That Bad?" thread I see all kinds of information that needs clarification, so maybe someone will come forward and explain it for me. Is Robt. Piland the owner of an illegal CB amplifier factory? Did "Concrete Man" at one time run DaveMade? Why is Dennis O. so panicky about word getting out that he helps illegal amplifier guys with their designs? What's the average yearly profit from an illegal amp company? Who arranges the distribution? How many amps are sold per year (guess-timate) by various underground amp mfgs.? Also, is the business run by gangs like Crips, etc., or do you fellows simply imitate the gangbanger lingo so as to appear more threatening to outsiders?

Since you guys believe that the laws are a joke and are meaningless like a traffic ticket and you'll never get busted in a million years and you're not doing anything wrong anyway - there's really no reason to hide. So let's make a clean breast of it, OK fellows? (Even you, Mr. Jay In The Mojave: add your your ham call to your next post)

And how come there are so many HAMS acting like rules don't matter? I was thoroughly disappointed when I saw one post where a ham advised a CBer that an illegal 300 watt amp would be better for him than an illegal 100 watt amp. It's very sad.

Yeah, I have told a few people about this and one person guessed it could have been some kind of antenna matcher concealed in some kind of mount so the guy could use different radios or bands for who-knows-what reason. The woman did specifically say CB, not ham, but then again you see people selling Motorola trunking radios on eBay as "CBs" so it could be anything...

Join your under-the-bridge fellow dweller in my kill file.This last post solidifies your purpose and identity. My parting words to you will more than likely fall on deaf ears since you demonstrated incredible incomprehension in the past, but, it simply is not illegal to manufacture amplifiers for export, no matter how much you children cry about it! Anything else you say is pure conjecture, guesswork, hallucinations, and in some instances, bordering on slanderous.

From: Dean <deanntx@tyler.net>
Message-ID: <3A450D4E.20FC0657@tyler.net>
Source record: 65059

This radio is just a couple of months old, and very rarely used. It is in new condition with a 100 watt Twister installed in the radio. The internal speaker had to be romoved to make room for the Twister, but I will include an external speaker.
I will also include a Astatic D104-M6C Power mic that is in new condition as well.

Asking $350 plus shipping for it all.

It has been a week now, that I have been listening to CB channels 1 through 23 in San Jose, California. I get static and noise.

I tested this old rig with a channel 14 walkie talkie a few months ago. I could talk to myself OK.

Can it be that there is really nobody left on CB?

When I transmit, my TV set picture shows interference, so I figure I'm getting out, but nobody answers. I even tried channel 9, where all those REACT people used to be. Nothing.

On channel 5 I can hear some intermod singing behind the noise, like skip of 10 weak signals at once, but nothing is intelligible.

Is CB dead?

Bill, this is for mobile use in a big truck. I am not interested in the toys such as roger beep and echo. I hate roger beeps with a passion. I am interested in a radio with plenty of power and the extra channels. Another radio that caught my interest was a Ranger 2970. I would be glad to hear opinions on this one. Thanks

Source record: 65079

The term "100 watts" doesn't mean much until a suffix
is added to it. In other words, is it 100 average, RMS, PEP,
or peak? It's like saying an antenna has 10 "DB" of gain.
Without a reference it doesn't mean anything.

100 average (aka RMS) watts equals 400 peak (aka PEP) watts.

If N4CDG is asking what the cleanest 100 average/400 peak
watt 10/11 meter monoband (as opposed to broadband and band-
switched solid-state HF amps) amp is, I would say the
Blue Face XL450 (can say Cobra, Galaxy, Palomar, or Magnum
on the front panel) is it.

3647. Re: Coax Question

Newsgroup: rec.radio.cb
Date: 2000-12-24 01:05:34 UTC
From: Handy Andy <CodysPC@Iserve.Net>
Message-ID: <sqia4toea7qkbn71gp85h1uie3nrt95uul@4ax.com>
Source record: 64969

Greetings!

Doc, show me a man that believes "Coax length doesn't matter" and I'll show you "A man that has no experience in putting any radio system together."

There's too many variables in real life to simply discard the fact that coax does what it does.

All I've seen is quoting direct and verbatim from books, but not one shred of direct evidence from the real world to back up the length doesn't matter claims. Koax Kops haven't given anyone any methods or techniques to try for experiements to prove that side of the story. At least I don't get those results. I get results similar to events that I am discussing here - are you on the same page as everyone else?

A dummy load doesn't radiate? LOL! Well, so much for the lossless coax superconductor theories. We just try not to generate interference with other stations - but we've had conversations on dummy loads before and they are very effective for short range stealth "Snipe hunts".

:If coax length didn't work like it does when antennas are not resonate
:due to problems with poor ground images on one location - steps need to
:be taken to fix the problem - either by re-locating the antenna or
:improving ground image area by fixing the mount connections.

And yet someone can re-create these 'myths' - as the Koax Kops call it, simply by putting up an antenna and having problems.

If you look back, and I seem to have to repeat it all the time I'm out here, my posts are for the issue that coax length shouldn't matter you need to fix something.

Don't believe me? Re-read the posts. See the statement ":" above. That is where I stand on this issue, no one can change that.

Simple problems that generate and perpetuate the myth are actually methods that coax properties have, and will always occur, when you use antennas over a conductive surface that is not ideal and try to make it work like a dipole.

"There's two sides to every element" means just that - you need the other half of the image to make the system work. When it's not ideal, no antenna that is resonate on one particular ground will be able to be resonate on all types of surfaces.

By saying "Coax Length doesn't matter" doesn't resolve certain issues.

Don't beleive me? Re-read my posts.

:+>
:+> I agree. Some of arguments here are because people are not clearly stating under
:+> what conditions their premises are under. Also, you need to read and think about
:+> what other people say before responding. For instance, I saw an argument between
:+> Coaxlength and somebody else about 50 + j0 defining resonance. It was clear
:+> everybody knew an antenna with a complex impedance of Anyvalue + j0 equals a
:+> resonant antenna. Fine.

It's the above, that makes this interesting...using the Rohm value
with no reactive component shows resonance at that particular
impedance.

With the above in mind, you will need to understand the coax will then
show it's own impedance due to a non-reactive load.

Making the Rohm figure closer to 50 ohms with no reactive component
brings you closer to a 1:1 SWR when you are checking with 50 ohm coax.

:+> I am still waiting to hear what (wave) length of 50 ohm coax I need to achieve a
:+> 1:1 match at the radio when the antennas feedpoint impedance is 37 + j0 Ohms.
:+> Anyone who claims you
:+> can adjust the SWR by changing length should be to answer this simple, unanswered
:+> question.

What is the frequency of interest?

I will also add, since you have no reactive j in the above, you will
see more like an SWR of 1.7 on an SWR meter. Is that acceptable?

Regards!

:+> On Fri, 22 Dec 2000 15:45:29 -0500, Handy Andy <CodysPC@Iserve.Net>
:+> wrote:
:+>
:+> >One thing that is not mentioned in these posts, is dealing with a
:+> >known impedance of an antenna over a ground system.
:+>
:+> Well, one thing that I have _never_ seen is a 1/4 wave vertical that
:+> measured at the ideal impedance of 36.5 ohms. Or 50 + j0, for that
:+> matter. I very rarely see an antenna that isn't reactive to some
:+> degree. There are just too many variables to make the definitive claim
:+> that any given antenna "must" behave this way or that way.

And it states in every antenna book that antennas HAVE reactive
properties - they aren't perfect conductors. Tuning the antenna
changes those properties. But the coax itself can't change it's own
characteristic impedance - it exists.

In some examples, using coaxial baluns for the matching network, you
are using the coaxial lines inherent properties to provide a tolerable
SWR just so the operator can get on the air even when you have a
non-resonate antenna.

A reciprocal event would also incur that if the antenna was tuned for
resonance using a particular type of counterpoise, re-creation of that
counterpoise may not always be possible in the real world. This would
make the antenna appear to be non-resonate, even though the antenna
could use it's reactive properties, in conjunction with, the coaxial
lines own, to appear resonate to the radio.

Only now, we have a requirement that the antenna has to use the coax
to provide a workable SWR for the operator to use their station.

And therefore the antenna and the coax are now a single antenna, the
feed line [read:coax] is now part of the antenna.

Granted, it's not efficient, but it is a workable solution.

:+> >snip>Using a special length, we DO cancel out unwanted
:+> >reactance [and is why they simply avoided the [25ohm - 5j or - j5]
:+> >equation - you can get an antenna to show lower SWR when the reactive
:+> >component is a higher value.
:+>

:+> The reality is that sometimes even just moving the coax can change the
:+> SWR, possibly due to radiation being absorbed by the shield, or even
:+> proximity to a ferrous surface. You just can't tell until you get out
:+> there and do it.

Exactly, it's not a possibility it's a fact. The coax is now part of
the antenna system and the field around the antenna is also being
absorbed into the coaxial outer shield - and why I am suggesting to
the "Koax Kops Kopys" that are out here that they have no basis for
forcing such issues in the real world. The real world simply does not
work that way.

And is why I suggest in vehicle mounting and installs, "mount the
radio to metal inside the vehicle". Just for the purpose of RF having
somewhere to return to without having to use the coax to accomplish
it.

Fixing the problem for a customer is not hard, but if the customer
wants it just the way it is, we have to abide by their wishes.

Don't worry, I did fix the problem in the above example. The solution
was to replace the coax, put on a new PL259, and the kid is fine and
happy with it, even though the mount has a little rust and uses 18' of
coax [LOL]!

:+> >What could have cornered them, and what was eventually being discussed
:+> >but was later avoided [that was the hint] was the coaxial dipole and
:+> >how they wanted to know about radiating coax.
:+>
:+> They would have just denied it. No point.

It's a shame that "Koax Kops Kopys" will never get to understand that
there is a more important function that coax exhibits. It's something
that you *can't* change, and that is it's own reactive properties.

Tuning an antenna is one thing, coax can't change - that seems to be
the hardest part they don't understand. Are we supposed to change the
coaxial line to something that fits when we have a problem? I thought
we were supposed to tune the antenna first, or is what we all agree
to? <It's what makes this whole thread so humorous.>

If you find a sale on 36.5 ohm coax, could you pass that along?

[LOL]

:+> >Thats why I posted conjugate match. They can't get past the fact that
:+> >the antenna is no longer "the antenna" - both the coax and the antenna
:+> >are now a single unit. And depeding on how the coax is used, can be
:+> >the "shorting stub" [open end] or the antenna itself can be the
:+> >"tuning stub" used with this given length of coax.
:+>
:+> The shield can indeed radiate when, as you say, it becomes part of the
:+> antenna system. This is not always desired or forseen, but it happens.

:+> And here's another one for the notebook: When there is RF on the
:+> shield, and when that RF is choked short of a multiple of a 1/4 wave
:+> from the antenna, you will get harmonics. Sometimes the choke doesn't
:+> have do be much, such as close proximity to ferrous materials, or just
:+> a kink in the coax. That's why it is good practice to wind excess coax
:+> in a figure-8, not a coil.

So why are the "Koaxial Keystone Kops Kopys" quad-K's ;-> having such
a hard time understanding this issue?

It's something that a customer wants. We have no choice as installers.
Even though the real solution is known - the customer doesn't want it
fixed, it's working fine!

Gosh, not to sound insulting, I would just fix the problems and be
done with it. I don't know what all the fuss is about...?

In regards to harmonics, - I've seen this, it acts like a wave trap.

The antenna, being reactive, does add it's own reactance and change,
or alter, the waveform when you are dealing with a reactive system
like what I've experienced in your example above. Energy is reflected,
as to what levels depends on the determinant jX factor.

This might help shed some light on that subject.

Some CB radios' in their output network, have a 52-54MHz trap/low pass
filter using a particular wind and capacitance to supposedly attenuate
this.

Problem though, it has a high impedance to arrival of these waves as a
part of noise filtering done for the purpose of input tuning to help
lessen receiver noise. As the harmonics that got past the network
return to the radio, they are not attenuated, so it re-reflects.

When you have radiating coax like in the above example - the radio
itself doesn't reflect or attenuate harmonics in the power to the coax
properly, it forms a tuned circuit using the network inside both the
radio the coax. The radio will actually refuse to attenuate the
harmonics that originally passed thru the network into the coax, as
the antenna appears as a high impedance to this, it reflects this back
to the radio, and the radio's network doesn't attenuate the harmonics
- ad verbatim, and the coaxial line is forced to lose this somehow as
a loss.

A field is generated around the coax at this point, and it's simply
due to the antenna and the radio don't want it. The coax is then
forced to lose this energy and hence a harmonic problem.

There are CB radios that have the 52-54MHz filter that works right.

You can check for this using a MFJ-259B and see how the radio will
react with the 52-54MHz trap by putting the MFJ right to the end of
the radio with a coax patch cord. It makes an interesting view of just

what goes on back there.

:+> >I hope this helps you, and I'm simply letting you know that you are a
:+> >good source of information about antennas. I'm impressed with not only
:+> >how you conducted yourself, but your knowledge. If you have a web page

:+> >yours to help provide more information.
:+> >
:+> >Would you be interested?
:+>
:+> I have a web page, but it has little if nothing to do with CB radio.
:+> It deals more with my dabbling in that lowfer stuff, 160 - 190 KHz.
:+> It's more of a challenge to get a clean signal out with just one watt
:+> and a non-resonant antenna. It's a band for people that know what they
:+> are talking about, not for Koaxial Keystone Kops.

Email me the URL I'd like to take a look at it, please. I'd like to
see your efforts on this. Sounds interesting.

Sometime, I'd like to demonstrate a "coffee can" antenna - a mag-mount
and a random length of coax, with a PL-259 connector on a coffee can.
And this does provide an 1:1 SWR.

A CB'er showed me that trick, "unbelievers" *should understand* that
even when you use a specific length of coaxial line, the mounting
location and counterpoise for a CB is what makes this system work to
determine SWR and how low this ratio will go. Leave it to a CB'er!
LOL!

Regards!

Message-ID: <2nna4toibq4cme8up1a67d5uqru6578e00@4ax.com>
Source record: 64975

Greetings!

Doc, you're reading the wrong group! That must be your problem, we're here in rec.radio.cb, are you cross posting?

Doc, show me a man that believes "Coax length doesn't matter" and I'll show you "A man that has no experience in putting any radio system together."

There's too many variables in real life to simply discard the fact that coax does what it does. It simply reacts to a reactive load.

All I've seen is quoting direct and verbatim from books, but not one shred of direct evidence from the real world to back up the length doesn't matter claims when real world events place their variables into these setups.

Koax Kops haven't given anyone any methods or techniques to try for experiments to prove that side of the story. At least I don't get those results - it's formulas, no testing the theories. I get results similar to events that I am discussing here - are you on the same page as everyone else?

A dummy load doesn't radiate? LOL! Well, so much for the loss less coax superconductor theories. We just try not to generate interference with other stations - but we've had conversations on dummy loads before and they are very effective for short range stealth "Snipe hunts".

I'll reiterate..
:If coax length didn't work like it does when antennas are not resonate
:due to problems with poor ground images on one location - steps need to
:be taken to fix the problem - either by re-locating the antenna or
:improving ground image area by fixing the mount connections.

And yet someone can re-create these 'myths' - as the Koax Kops call it, simply by putting up an antenna and having problems.

If you look back, and I seem to have to repeat it all the time I'm out here, my posts are for the issue that coax length shouldn't matter, you need to fix something.

Don't believe me? Re-read the posts. See the statement ":" above. That is where I stand on this issue, no one can change that.

Simple problems that generate and perpetuate the myth are actually methods that coax properties have, and will always occur, when you use antennas over a conductive surface that is not ideal and try to make

it work like a dipole.

"There's two sides to every element" means just that - you need the other half of the image to make the system work. When it's not ideal, no antenna that is resonate on one particular ground will be able to be resonate on all types of surfaces.

By saying "Coax Length doesn't matter" doesn't resolve certain issues.

Don't believe me? Re-read my posts.

On Fri, 22 Dec 2000 20:55:11 -0600. The monitor used it's electron gun to shoot holes into a dissertation done by 'Doc <w5lz@oio.net> as he attempted to answer "Re: Coax Question" with the following statement:

:+>
:+> Handy Andy,
:+> I want to thank you for an amusing post. Your
:+> antenna and feed line ideas are almost as good as
:+> the sunday funnies.
:+> 'Doc

: Because that is not quite right.

Sorry, Sparky. He is exactly correct. If the feedline has loss, and all have some, the if the SWR is not 1:1 - the SWR changes as you move back towards the source. However, for the transmission lines we use, the change is rather small.

... deleted ...

: Given: a coax, 50 + j0, at 27MHz, and V = 0.66. A 1/4 wavelength of
: that line will be approx. 6 feet. Another half-wavelength, 12 feet,
: gives the infamous value of 18 feet. At both those points, and every
: 12 feet afterwards, the standing wave will not be detected. The SWR is
: not changed, nor will the standing wave disappear.

It certainly can be detected. The voltage and current do not disappear, although the resultants may be reduced or increased.

Think about it. The forward and reflected power have to be constant along the length of transmission line. You cannot have power transfer if either the voltage or the current are zero.

But the vector products of the voltages and currents can be zero - if you have a lossless line and the line termination is either open or shorted.

Look at cars when you drive. If it's anything like here (North Carolina),
the days of every car having a CB antenna are over.
CB here in central North Carolina is mainly truckers on Ch. 19 - and other
than 18-wheelers, you see (a few) antennas mainly on pickups used for hunting
or farms.

Let's discuss why SWR meters can read different values at different
places in the coax.

When you connect coax to a load (either balanced or end-fed), unless
you take precautions to eliminate it, you get currents on the outside
of the coax. This is undesireable.

The currents can come from two sources, 1) coupling from the antenna
to the coax and 2) leakage of current from the inside of the coax
shield to the outside (instead of all the current going into the antenna
or antenna ground - if it has one). Both of these situations can occur,
even if there is a perfect 1:1 match.

Funny thing - if you want to minimize such currents, then the length of
coax to avoid is any odd multiple of a half-wave (antenna formula lengths,
not velocity factor lengths). 18 feet of coax is one of those lengths
to avoid. So people who insist on using 18 feet are guaranteeing that
they are maximizing these undesireable currents on the coax. Divide 492
by 27 to verify this is a resonant 1/2 wave length.

Those currents on the outside of the coax can also cause faulty reading
on an SWR meter. If your SWR reading changes when you touch the meter
or grab the coax, then you definitely have currents on the coax.

Hey something to agree on!

>When you connect coax to a load (either balanced or end-fed), unless
>you take precautions to eliminate it, you get currents on the outside
>of the coax. This is undesireable.

The precaution may be to use a balun or to minimize trouble by
de-tuneing the outside of the coax.

>The currents can come from two sources, 1) coupling from the antenna
>to the coax

The above is called "parallel current".

>and 2) leakage of current from the inside of the coax
>shield to the outside (instead of all the current going into the antenna
>or antenna ground

????

>- if it has one). Both of these situations can occur,
>even if there is a perfect 1:1 match.

3. Another type of current can flow. It is caused by the spacial
relationship of the coax to the antenna.This is called "antenna
current".

>Funny thing - if you want to minimize such currents, then the length of
>coax to avoid is any odd multiple of a half-wave (antenna formula lengths,
>not velocity factor lengths). 18 feet of coax is one of those lengths
>to avoid. So people who insist on using 18 feet are guaranteeing that
>they are maximizing these undesireable currents on the coax. Divide 492
>by 27 to verify this is a resonant 1/2 wave length.

The above is backwards.

Parallel type currents WILL cause a change in the SWR reading
with line length. Parallel currents mimic the counterpoise currents.
They tend to make the coax a part of the antenna. With this in mind
the current is highest at the termination and the voltage is at its
lowest at this termination. This repeats itself every half wave. 18
feet is a half wave away and because of this can also be a voltage
minimum. This voltage minimum on the outside of the coax is most

desirable if you don't want the SWR meter to respond to it.This all assumes that conditions are such that unwanted parallel currents are being induced.

>Those currents on the outside of the coax can also cause faulty reading >on an SWR meter. If your SWR reading changes when you touch the meter >or grab the coax, then you definitely have currents on the coax.

It is not really a measurement error since what the instrument reads is the actual SWR on the line, or should I say the instrument is giving a good indication of what type of load your radio is seeing.

The SWR reading on THIS type of line, (unwanted parallel currents) is determined by the composite load of the antenna, and the outside of the coax. Since changing the line length (or position), is one of the components of this composite load, the SWR reading changes too.

Fire extinguisher ready. Flame away.

Ha! The cbers are more likely to take over ten than you are to take over 11. You are only half right. See, we just got more frequencies, there are more NEW exports flooding the market than there ever was and prices are rapidly declining on NEW gear so we don't have to buy your broken castoffs that you sell on ebay 'cause you are too ignorant to have the know how to fix your stuff. Take over, hahhahah! In your wildest, exotic, wet dreams only. Besides, since most cbers can squash you with their driver now, what makes you think incompetents like yourself will ever be able to be heard over most cbers, on ANY band? You aren't a hammie anyway. Just a wannabe and you can't even figure that part out correctly.

This is the problem -- you are using grade school math.
You need to move up to complex numbers.

The example you give here is actually correct but only because
you have given the two impedance points along a transmission line
where the impedance is purely real. At all other points, the
impedance has an imaginary component.

Your example like a stopped clock; it is still correct at two times
during the day.

You say that there are points along the transmission line where the voltage to current ratio equals the characteristic impedance of the transmission line. You are only half right (and half wrong). The MAGNITUDE of the voltage to current ratio does indeed equal the transmission line characteristic impedance at these points but the angle does not. The angle will not be zero degrees as found with a true 1:1 SWR.

Sparky, you had this MAGNITUDE problem before, didn't you?

I don't disagree that coax has a certian attenuation. I disagree that
SWR changes with line length, as I explained in the part you . . .

>if either the voltage or the current are zero.

I never said they disappear. I said, "At this point the standing
wave is indistiguishable from the signal, since it has the same
impedace as the signal."

I should have qualified that by saying the problem is with the method
of detection. Some cheap "SWR" meters measure only impedance. Many,
including most that are built into CB radios, measure the RF voltage
in forward phase and compare it to reverse phase, but do not
compensate for the resulting standing wave, which can distort the
measurements. A few meters measure properly. SWR meters are like
anything else: You get what you pay for.

>But the vector products of the voltages and currents can be zero - if
>you have a lossless line and the line termination is either open or

100% reflection. True story.

>of the coax. This is undesireable.

Ok.

>The currents can come from two sources, 1) coupling from the antenna
>to the coax and 2) leakage of current from the inside of the coax
>shield to the outside

1) Coupling from the antenna to the coax is caused by an inadequate ground. You can think of a balanced line or load as having it's impedance between the two conductors, and an unbalanced line or load as having all it's impedance on one conductor and the ground or shield is zero. One problem with unbalanced lines and loads is when the ground, the conductor that is supposed to have zero impedance, doesn't. An unbalanced load without a good ground may indeed show an unreactive impedance of 50 ohms across it's connections, but the impedance of the ground is not zero, and the impedance of center conductor is not 50 ohms. Result: the antenna couples RF into the coax shield through the unwanted impedance in the ground. Also, the coax, an unbalanced line, expects the full load to be on it's center conductor. So while a 1:1 match is expected, there is really a mismatch because of an inadequate ground, and power is reflected.

2) When a standing wave exists on the inner conductor, there are points where the impedance radically differs from the impedance of the coax. When the impedance is too high, the coax tries to dump the excess potential through the dielectric. A capacitance is established between the center and the shield that is not balanced with inductance. The result is that RF is capacitively coupled to the shield.

> (instead of all the current going into the antenna
>or antenna ground - if it has one). Both of these situations can occur,
>even if there is a perfect 1:1 match.

If you have a 1:1 match, then all the power is going to the load. How can current be leaking from the coax if it is all going to the load?

>Funny thing - if you want to minimize such currents, then the length of
>coax to avoid is any odd multiple of a half-wave

Why?

> (antenna formula lengths,
>not velocity factor lengths). 18 feet of coax is one of those lengths
>to avoid. So people who insist on using 18 feet are guaranteeing that
>they are maximizing these undesireable currents on the coax. Divide 492
>by 27 to verify this is a resonant 1/2 wave length.

Even if the designer intends to make the shield radiate, as in the
case of a coaxial dipole, he still must observe the velocity factor of
the coax. Why should this be any different?

>Those currents on the outside of the coax can also cause faulty reading
>on an SWR meter. If your SWR reading changes when you touch the meter
>or grab the coax, then you definitely have currents on the coax.

You bet. Why? Because the capacitance of your body loads the coax. The
same thing happens with inductive objects.

Hello All, thought you would get a kick out this one:

Big Bob just out of prison, said he would return Loud and Clear. Well he did. Last night the local channel rocked!

Big Bob comes on and says that he is back and wants to shoot a little skip and just wants to drop the hammer on a few.

Listing to all this I turn up the volume, and listen to the show.

Big Bob says: "Heah you hear me" Pinning my meter on the Drake R8, from about 5 mils away.

A local responds: "Heay Bob you out of jail, we need to go out and have a few"

Big Bob says: "Why yeah maybe even a few after that, ta toast Santy Clause!"

The local responds: "Yeah I got Christmas money and the car tonight. Wow Bob what's ya running over there a old Voice of America Broadcast Transmitter?"

Big Bob say: "Nope it ain't that big. Its just a pair of 4CX250's drivin a pair of 3CX3000's settin on low power. Don't want to disturb anyone!"

Big Bob comes back on sayin: "Heah why don't all the locals slide on over to my place and we'll toss a few down, the ol lady is ah cookin cookies and stuff. And I got room to park a Boeing 747 and I'll make sures all of ya leaves in ah taxi, all safe, sound, and liquored up!"

Laughing while falling out my chair, drying a tear from laughter. I think at all about all the stations out there hauling buns over to see a old friend recently released from prison and enjoying the Christmas Seasons.

God bless ya Big Bob!

Jay in the Mojave

Well some call it a linear, some call it a modulator, it acts more like a modulator which combined with the radio power does well over 100 watt swing, thus creating quite a bit of audio performance.

Handy Andy,
I think I'm posting in the right place. I don't cross-post
at all.
The whole point is that I ~can't~ refer back to your post
because they are not correct in most cases. But, your correct
in that if I used your twisted explanations, sure, your posts
would make sense. You know, "garbage in, garbage out'.
Since I do think that the length of the feed line really doesn't
make any difference, I must not be able to make an antenna 'system'
that works. But, the antenna 'systems' I've used over the last
30 some years have worked reasonably well, in some instances, very
well. So, I don't think your opinion as to my antenna making
ability is close to reality (like your ideas about impedance/SWR,
etc).
All joking aside, if you would go back over the theory with
an open mind, I think you would find that you would have to
re-evaluate some of what you've said. You do real well, and
then you seem to take off on a tangent...

Any CB; base, mobile or handheld; is limited by the antenna. Handhelds, with their small inferior antennas, are just about useless. Most don't have ANL circuits, which limit their usefulness even more. Get a decent mobile radio and best antenna you can afford. No thru-glass or cellular look-a-likes.

If you need portability, go with FRS or MURS.

You need to remember that many of the more recent viruses are "self replicating" IOW they trick the system they infect into sending out emails with the virus attached to it. The email you get with viruses attached that are easily traceable are usually this variety.

The SPAM mail you get is a different story and should be reported to the ISP of the sender if at all possible. It sometimes takes some work to dig through the headers but if you do there are a couple of good resources for tracing it back to the originator:

For domain names (*.com, *.net, *.org, *.edu) use:

http://www.networksolutions.com/cgi-bin/whois/whois

For IP addresses (xxx.xxx.xxx.xxx) use:

http://www.arin.net/whois/arinwhois.html

Typing the information in will lead you to an email address you can contact to report them. Of course there's always the delete button.

Okay, there's quite a number of questions from you all, so let's get right to 'em.

First off, it seems people are working too hard to locate and/or intimidate me. I'm not sure why, except perhaps the illegal amp builders are scared stiff I might turn them in. I won't. I just want some info, that's all.

And, no, I'm not N8WWM. I'm Aaron Harold Voobner. Just a guy who's had his fill of illegal dufuses mucking up his local CB band.

There is also a raging controversy that suggests that many people believe I am Mark Fuller. I would like to restate, that no, I am not Mark, but I have "read" him. However I can see how in certain dim brains anyone who can write an itelligent sentence without mispelling would appear to be Mark Fuller.

A Mr. TollFree writes to say that Mark Fuller was beaten to a pulp by unknown assailants and suggests that CBers/IBers or Dennis Ostrowski performed the vengeful act. I ask that any proof or evidence of this be brought forward, as this is a serious charge against Mr. Ostrowski and/or CBers, Toll.

Mr. Handy Andy writes to proffer his opinion that if I am Mark, I will react in some predictable way to his trick question about "operating CB while intoxicated". Andy, you want my opinion if this should be a prosecutable offense or not. I honestly have no idea. I never thought about it. I suppose that after a few drinks the CBer wouldn't be able to tune his splatterbox and the thing would blow up. End of problem.

Someone else writes to say that mentioning names in connection with illegal CB amp manufacturing could be construed as "slander". Hey, wait a minute. I thought you guys felt that breaking of FCC rules was minor league stuff. If so, then why the beef if someone names names?

Both of you are right. Unfortunately the point was the reckless
misidentification of innocent persons. I have little problem with the
heat from the debate over widespread illegal CB practices. What I have a
problem with is completely unrelated people portrayed as me; with the
person engaging in this reckless behavior acting as if anyone other than
those individuals can give him "permission" for his reckless behavior.
If someone has a beef with me, then have it with me. Using innocent
persons as a weapon against me is, at most,
expected from people who endorse criminal radio behaviors.

>thing, feel that this info is correct and valid.

I don't expect much from advocates of criminal activities. I would, however, strongly suggest that you be very careful not to involve innocent people. Legal, illegal? guilty, innocent? I know it doesn't make much sense to you. But in the two cases Dennis presented (and I mentioned above), you will be dealing with people I don't even know. Continuing to allege these people are me is the cowardly thing to do.

>So if not, maybe as "The law abiding citizen" that you are you should
>inform this individual of this and provide legal counsel for him.

It appears Dennis identified two different individuals. And yes, I believe they will be contacted. But your concern was about as genuine as Dennis's wasn't it?

It can't be dead, i was talking to some locals on 17. There are some big strappers in San Jose. I myself am only 1 1/2 hours drive away from San Jose, and the CB scene is pretty lively. You might wanna get your radio or antenna checked out.

ok aaron, you failed again to answer any of the actual questions here are
the few that were asked that you failed to answer. What are you waiting for
.Plus No one asked if you were Fuller you take that assumption. and Yes
the use of names connected with a criminal activity with no proof to back up
your accusations is slander and perhaps much more.. Being an asshole is
priceless we are waiting for your answers.

1)btw why dont post thru your aol account?
2) How much money did
you make this year>
3)Care to post your tax return?
4) where do you live?

In and of itself, it isn't. Now assume that he gets pushed in front of the 8 o'clock trolley, has a 16 foot concrete statue of a Toledo Mud Hen dropped on him, gets in a crossfire of Michiganders invading the Toledo Strip, or gets beaten to a bloody pulp by a committee of his neighbors. Now try defending your comment. Not the brightest comment in the history of newsgripes.

Speaking of which, and not wanting to be listed on the bozo file as a 'known associate', mind if I treat you like you had a social disease for a while???

> I have a Boomer 400 mobile amp and was woundering if someone knows the
specs on
> this amp,

I can give you some generalized info.

> freq range/

It has no output filtering and employs the
broadbanded design that is supposed to cover
3-30 MHz. The downside is that it doesn't
have any gain leveling, so it'll become more
and more unstable due to increasing gain as
the operating frequency decreases. It was
designed as a CB band amp.

> in and out power/

It has quite a bit of gain, but it compresses
when you try to get every watt out of it. Up
to the rating of the transistors (it uses four
70 watt rating transistors) I would say the
gain is around 13 dB or 20 times power multi-
plication. That means 14 in for 280 out. By
the time you get to the label claim (400) the
gain has compressed by at least several dB.
Optimistically, the gain is around 10 dB (10
times power multiplication) at the label claim.
That means 40 in for 400 out. As for a maximum
power spec, I'd say the labelclaim is about as
hard as I'd want to push it.

> current draw/

That depends on how it is operated, but I'd say
around 20 amps is typical.

> ect.

Those amps are pretty unstable, and the bias is
grounded out at the factory even though the label
claim is for AB biasing. Reactivating the bias
(at a reduced (Class B) level) and adding negative
feedback makes those amps alot nicer. If you're
interested, I can provide a specific mod package.

The 88 and 99 are popular, but if you don't need all
the extra stuff, why not try something like an export
Grant or a Midland 79-290. The idea is to not buy a
radio with more crap than you need. I know too many
guys with 99s in trucks where the channel selector is
damn near rusted in place because they never change
channels. Buy what you really need, not what you
think you might use.

> Another radio that caught my interest was a Ranger 2970. I
> would be glad to hear opinions on this one.

A separate radio and amp is a better choice in my
opinion. 2970s have too many bugs.

Hi Nick,

The first thing to do is get rid of MS Outlook!! It's a horrible product that should never have been foisted upon the world.

The second thing to do is find better mail and news readers. Qualcomm has a free version of their Eudora mail app, and Forte has a free copy of Agent (newsreader). Both of these progs beat MS Lookout for functionality, ease of use, and security. You can also use Netscape for mail/news, but be sure to disable java in mail & news messages...also, if you can, find an older version (4.X will work nicely)...the latest version (6) is a big hunk o' poo.

The third thing to do is keep your virus sigs up to date, and scan any and all attachments you receive before looking at them. It doesn't matter whether it's from a total stranger, or from your best buddy (who may have inadvertently sent you an infected file)...scan them all.

Chances are, if you use Lookout, you probably also use MS Word. If you do, be sure to disable macros, otherwise an innocent looking document can take advantage of some security holes in the crappy program, and have Word do nasty things to/with your computer.

Regardless of what some tagnut down at Compusa may tell you, Microsoft is not your friend. They do not make computing more fun, nor do they make people more productive. They sell crappy, half-baked products that can often create more problems than they solve.

As for people getting their hands cut off for sending you a virus (and/or reporting them to an ISP), keep in mind that if you receive a virus these days, it's most likely been spread with Outlook. The person who sent it to you had no idea (s)he was doing so. Some simple lines of code the (s)he rec'd in an email had Outlook do it all on its own.

The *only* person to blame if your computer gets a virus is the person looking back at you from the mirror...

How do you 'disable macros' in MS Word? I can't find the option or
setting that does that. I have an option 'checked' that says to protect
against macro viruses but that's all I can find.

I would expect the 400 watt limit is either a peak amount
or the amount of DC input watts.

I would think a 4 device amp would use a bit more DC power
then 20 amps. Collector current for each device can be from
10 to 15 amps.

I draw a good 20+ amps from a Texas Star 250+ (I say 250+
because it is no longer in it's stock configuration) That's
enough to be heard coast to coast on sideband in the mobile.
I just did it at 9:25PM EST while running out for coffee.

Also in with regards to using MS Word it's a good idea to make your Normal template read only. Some viruses overwrite the Normal.dot file and use it to replicate themselves. Use the Find...Files command in Windows Explorer and find the normal.dot file and change the attributes to read only. If you want to change it down the road then you can change it back.

That's the only one.

You can disable windows scripting host.

Rename C:\windows\wscript.exe
to something like wscript.disable.exe

There are few applications out there that take
advantage of windows scripting host. And the
majority of those are viruses.

I guess I'm the exception to your rule. Except for a small number
of installations that relied on quarter wave matching transformers,
I have never had an installation that required a specific length of
coax.

> All I've seen is quoting direct and verbatim from books, but not one
> shred of direct evidence from the real world to back up the length
> doesn't matter claims.

I don't quote specific experiences because they are SINGULARITIES.
Statistically, they mean almost nothing. Theory is based on countless
observations made over many decades. When I have a situation that,
at first look, appears to buck the theory, I study it to reconcile
the difference. My one observation cannot disprove tens of thousands
of observations; there must be an explanation. But that doesn't stop
you. You saw a coax length that appeared to matter; therefore, it
matters to you and you insist to the whole world that it matters
when you've got nothing but a misunderstood observation as your
evidence.

> Koax Kops haven't given anyone any methods or
> techniques to try for experiements to prove that side of the story.

Actually, I've posted quite a bit of information: from calculations
to descriptions of operation. And I'm always there to back it up.

I shoot a hole in these claims and I get no response but cheap,
personal attacks like "Koax Kops will never understand."
Put up or shut up. You can't do it.

> At least I don't get those results.

You see. This is exactly what I said. You say (paraphrased) "I didn't
see it therefore all that theory is nothing."

> And yet someone can re-create these 'myths' - as the Koax Kops call
> it, simply by putting up an antenna and having problems.

Which "myth" are you talking about? Be specific and show us what
is wrong with it -- or shut up.

> By saying "Coax Length doesn't matter" doesn't resolve certain issues.

Such as?

Claiming that a specific length does help is not only patently false,
it perpetuates a misunderstanding about RF and solves nothing.

And Sparky is wrong again. SWR is, in essence, the ratio of reflected
power to forward power. As you move along a transmission line with
losses from the antenna to the radio, the reflected power diminishes
due to attenuation. Furthermore, the forward power strengthens
due to less attenuation. The attenuation is making the ratio of
reflected power to forward power change. Thus, the SWR changes.

And it can be measured.

> >Think about it. The forward and reflected power have to be constant
> >along the length of transmission line. You cannot have power transfer
> >if either the voltage or the current are zero.
>
> I never said they disappear. I said, "At this point the standing
> wave is indistiguishable from the signal, since it has the same
> impedace as the signal."

Again, Sparky is wrong. The magnitude of the impedance is the same
but the impedance is not. If the SWR were 1:1, the impedance would
have an angle of zero degrees. When there is reflected power (anytime
the SWR is not 1:1), the impedance angle is nonzero at these points.

This IS distinguishable. A simple SWR meter with directional couplers
will detect it.

> I should have qualified that by saying the problem is with the method
> of detection. Some cheap "SWR" meters measure only impedance.

I'd say a meter that can actually measure impedance is good; not cheap.

> Many,
> including most that are built into CB radios, measure the RF voltage
> in forward phase and compare it to reverse phase, but do not
> compensate for the resulting standing wave, which can distort the
> measurements.

Absolutely false. Even cheap and built-in SWR meters use directional
couplers that immunize them from any such measurement "distortion."

It does matter, but not in the way that some claim. E.G - tuning for minimum SWR when the only coax is one length between the rig and the antenna.

: There's too many variables in real life to simply discard the fact
: that coax does what it does.

True. And what it does is precisely defined by known formulas.

: All I've seen is quoting direct and verbatim from books, but not one
: shred of direct evidence from the real world to back up the length
: doesn't matter claims. Koax Kops haven't given anyone any methods or
: techniques to try for experiements to prove that side of the story. At
: least I don't get those results. I get results similar to events that
: I am discussing here - are you on the same page as everyone else?

Would you believe anthing that was not quoted from authority? Have you tried the various experiments that I have outlined in various posts that would allow you to prove or disprove the claims I have made?

: A dummy load doesn't radiate? LOL! Well, so much for the lossless coax
: superconductor theories. We just try not to generate interference with
: other stations - but we've had conversations on dummy loads before and
: they are very effective for short range stealth "Snipe hunts".

Sure, a dummy load radiates. If properly constructed, it radiates little or no detectable radiation. It radiates it as heat instead.

The dummy loads that are commonly available do radiate a bit of rf. As you state, they can be used for Fox Hunts - not "Snipe hunts".

: :If coax length didn't work like it does when antennas are not resonate
: :due to problems with poor ground images on one location - steps need to
: :be taken to fix the problem - either by re-locating the antenna or
: :improving ground image area by fixing the mount connections.

: And yet someone can re-create these 'myths' - as the Koax Kops call
: it, simply by putting up an antenna and having problems.

No, a person can do something that appears (on their SWR meter) to do something that is not happening. I posted the reasons why this occurs.

: If you look back, and I seem to have to repeat it all the time I'm out
: here, my posts are for the issue that coax length shouldn't matter you
: need to fix something.

Unless you are using a matching section of coax with a different impedance
than the regular coax - length does not matter (except for the regular
small additional attenuation you get from resistive losses in the coax.

We are talking about one run of coax with a given characteristic
impedance here. Matching stubs are a different matter, as they are
either open or shorted at one end.

: Simple problems that generate and perpetuate the myth are actually
: methods that coax properties have, and will always occur, when you use
: antennas over a conductive surface that is not ideal and try to make
: it work like a dipole.

It does not matter if the load is bananced or not - the same rules
apply. If you think that earth conductivity does not matter with
dipoles, then you need to get some experience with them.

: "There's two sides to every element" means just that - you need the
: other half of the image to make the system work. When it's not ideal,
: no antenna that is resonate on one particular ground will be able to
: be resonate on all types of surfaces.

Actually, it probably will be resonant - but the load point resistance
will change, as will (most likely) the resonant frequency.

: By saying "Coax Length doesn't matter" doesn't resolve certain issues.

: Don't beleive me? Re-read my posts.

I believe I have addressed all the issues, and explained them, in past
recent posts.

False. And what it does is not always defined by known formulas.

Unwanted parallel currents are not defined by well known formulas
or the use of a smith chart. This is the crux of the dispute. The
"square heads" of this world must equate these formulas and the
use of the smith chart even if they have to ignore what their own
eyes see. Their own eyes see, if they have any long term experience
with mobile antenna installation, that the SWR reading can change
with different coax lengths. They are either ignorant or intentionally
blind to this happening.

That is why they are :"square heads". They can't see outside of their
neat little organized box. They deny what they can't equate.

Right on the money. You can argue about "ideal" transmission lines and "ideal" antennas all day, but they are only a starting point for the complex set of variables that are met in reality. Just a short list of things that can affect an antenna are: material (ferrous v. non-ferrous); corrosion; deposits (rain, dust, bird droppings, etc.); corona ball; proximity to structures; and the widely variable ground effects. There are many more. You can quickly move up to vector analysis and have integrals coming out of your ears, such as analyzing what happens when you start routing coax. That can be loads of fun if you are a masochist. Put all these variables together and you have what amounts to a "fudge factor".

The ideal system is the best place to start, but follow some simple rules to avoid problems. Like, use 18 feet just in case that bridge was too low, wind excess coax into a figure 8 just in case your jack handle gets lost, and double-ground your radio just in case a cockroach starts chewing on your wires. These are a few of many common practices, and there is a good reason to follow them - ignore them and sooner or later you will have problems.

To those of us old enough to remember Tarzan movies on the Saturday
afternoon tube, these common practices are named after the extras dancing
around the fire (in the tropics???) for $27.50 and a bag of used food
stamps. Lacking the time, interest, and money for a proper rehearsal,
they just sort of jumped around bellowing 'ugga-bugga, ugga-bugga'

So all the wondrous 'rules of thumb', rituals, and fetishes are known
collectively in our shop as UGGA-BUGGAs. So if you cannot justify
traditional practice in theory, just start chanting 'Ugga-Bugga,
Ugga-Bugga, Pow-KaPow'.

No argument there. What you call parallel currents are what I call common mode currents -- same thing. I've addressed common mode currents.

> This is the crux of the dispute.

Well, not in every case. There are a number of different claims being made.

> blind to this happening.

I've seen this and I don't deny it. But there are two big problems when discussing common mode current problems with coax length:

1) There is no specific length of coax that is likely to cure, or even help reduce, common mode current problem. These myths that require 18' of coax have no basis in fact.

2) Even if you found a length of coax that did reduce your common mode current problem, it would be a poor solution. There are several good ways to attack this problem; varying the coax length is not one of them.

> That is why they are :"square heads". They can't see outside of their
> neat little organized box. They deny what they can't equate.

Oh, and there is a third problem:

3) Folks who can't understand problems (1) and (2) won't engage in rational discussion/debate/research; they will just call you a "square head."

Midland 75-830.
That's what I got. Was looking for a small sized one for my car, but saw this was clearance priced and I figured I needed another toy.
It doesn't have much range with the rubber duck. Especially indoors or in a vehicle. The power supply/antenna attachment is kind of unhandy in a vehicle. It wasn't really meant to be used in a vehicle.
But outdoors it's really handy. I clip it to my belt when I ride bike. I got NiMH's for mine. My charger for my ham handheld works on the battery pack. Has about 2 mile range with full power and rubber duck. It's handy for short communication.
I'm still looking for a pint-sized one for my car. And another Kenwood BC-14 charger if anyone has one.
You might want to price NiCad's or NiMH's & charger before you get one if not included.

So, you wanted a new CB/10 Meter Base Antenna and the jolly guy in red done forgot to drop one off. Well, if you still want one, here you go.

4 - Brand new CB/10 Meter base station antennas being sold on clearance. These are Radio Shack brand stock number # 210-0969. They listed for $79.99 Their newest model lists for $69.99. So you still save at least $10!

$60.00 SHIPPED!

These are on clearance and can not be returned.

Postal Money Order gets it out in same day..... Checks must clear the bank before shipping.

PA residents "must" include 6% tax.

Fell free to inquire of my dealings before you buy.

If your transmissions are causing interference on your television, then im assuming that you are using a magnet mount antenna in your house, or some similar setup?

Buy a Solorcon Antron 99 and sitck the base of it about 36 to 72 feet up in the air. You will hear thousands of transmissions via skywave propagation from all over the United States, and the world, most every day.

I'll have to disagree here. Parallel currents can produce a bad
termination for the transmitter. A proper choice of coax length
won't remove these currents but will reduce the SWR measurement
at the transmitter. Thus creating a better load for the transmitter.
>
>2) Even if you found a length of coax that did reduce your common mode

I'll agree that the best solution is to eliminate parallel currents.
However from a manufacturers standpoint he knows that there
will be some installations that induce unwanted parallel currents.
If this is the case then 18 feet will best mask a parallel current
problem. That is why Wilson, Firestik and others will specifically
call out the 18 foot length.

*
*Note the "apparent".
****

Correct. What is measured in not the SWR at the antenna but what the impedance
the transmitter sees looking toward the load at some distance determined by the
coax length. Some equivalent impedance.

****
*Now, here is a quiz for you. A good RF meter (such as a Bird) uses a
*section of transmission line to tap off the voltages/currents necessary
*to measure the power on the coax. That line section is 50 ohms.
*
*Tell me what happens when the input impedance of the coax at the output
*of the meter is not 50 ohms. Is it possible that, due to this mismatch,
*that some of the reflected power is reflected back towards the antenna,
*rather than being measured by the meter?
****

If the source reflection coefficient is not zero, Yes the relected power from
the load will be reflected back to the load from the source. If refelcted back
to the load it would not necessarily be measured.

****
*What does this do, in an SWR meter, to the indicated SWR?
****

If the reflected power from the load is reflected at the SWR meter back toward
the load. Then I- will be zero and any SWR meter will not detect that current.
No reverse current therefore not reverse power. 1:1 reading.

That makes sense and kind of what I was searching for. I knew there had to be a
logical reason for why the SWR meter reads 1:1. Once pointed ou,t is becomes
clear as day.

```
*****************************
*Note that we are talking about measured SWR here, not actual SWR on
*the coax between the meter and the antenna.
*
*Another little quiz.
*
*Place your SWR meter at the antenna. Let us assume that there is a 2:1
*indicated SWR.
*
*Now, change the length of the coax between the transmitter and the
*SWR meter.
*
*Does the SWR meter reading at the antenna change? If so, why? If it
*doesn't, why not?
*******************************8
```

The SWR at the antenna will change only if the load impedance changes or the characteristic impedance of the coax changes.

*Bill these are hams you are talking to they no nothing about Bird Meters
*they use the Rad shack meters

Radio Shack's digital meter uses a dierctional coupler that is callibrated over
2 ot 30 Mhz. At 50 Mhz the power is off by at least 3 dB. I checked mine with a
dual directional coupler and a spectrum analyzer and found it to be as close as
any Bird meter. Though I check the power accuracy only to about 100 watts.
Unable to check higher power levels. What makes Bird meters so nice is with the
proper slug they are usable from 1 to about 500 Mhz and from 5 to 10KW power
levels. Still they are only 5% accuracy.

*analysis and have integrals coming out of your ears, such as analyzing
*what happens when you start routing coax. That can be loads of fun if
*you are a masochist. Put all these variables together and you have
*what amounts to a "fudge factor".
****

Yes all the above affect the antenna. SWR is solely determined by the coax impedance and the antenna's impedance. If the antenna's impedance is varying from location to location and from vehicle to vehicle, coax length is not going to alter that fact. Common mode currents induced on the coax in mobile installations are based on vehicle, radsiated power, and antenna type. Antenna location and the vehicle type cannot be used to predict common mode currents. Their influences can only be seen during installation and once recognized should

be taken care of before any antenna adjustments are made.

```
*****************************
*The ideal system is the best place to start, but follow some simple
*rules to avoid problems. Like, use 18 feet just in case that bridge
*was too low, wind excess coax into a figure 8 just in case your jack
*handle gets lost, and double-ground your radio just in case a
*cockroach starts chewing on your wires. These are a few of many common
*practices, and there is a good reason to follow them - ignore them and
*sooner or later you will have problems.
*
*Sparky, FLRC
*************************************
```

Double gropunding maybe overkill. Proper grounding to minimize common mode currents are necessary. There are proper methods to prevent ground loops and keep stable operation of the transciever in mobile operation.

:+> I have never had an installation that required a specific length of
:+> coax.

And this is what makes it difficult to understand the "total" issue of
the stance that "coax doesn't matter".

A simple case is those that purchased such antennas like those for CB,
both Francis, and Wilson, recommend a specific length to avoid issues.

One specific issue is being that location plays a role in the actual
impedance the antenna will exhibit at a point.

While tuning the antenna is the preferred and often the most
successful - we have another problem where the customer wants the
antenna put on only one way, and one location.

This is where the choice is lost. We, as installers, simply
have no choice here. So what does the customer do? It's none
of our business, but that is where the problems lie. They
claim that trimming the coax, or having to run a certain
length
works and is being told to their friends.

Yes, I agree, this is a special case, but why flame those that
do agree unless it's such a special case as above?

Case and point is the fact that antennas for CB, or any particular
type designed using a "test range" or controlled conditions, will
require the purchaser to recreate the ground image as stated in the
antennas own instructions manual for the antenna to provide the

expected level of performance - and low SWR.

If an antenna is designed, tested, wrapped, sold with the recommendations on the placard for a specific length, there are reasons for that. It was designed to give a particular type of performance using the ideal ground plane the antenna was originally designed for. If the counterpoise requirements can't be met, at least you'd see the coaxial impedance the antennas reactive properties will conjugate to and "fool" the meters into showing a tolerable SWR. This doesn't mean they have a 1:1 or so SWR, they have a tolerable SWR the radio can handle.

Wilson, claims that if you place one of their antennas on a vehicle that is a sub-compact, or in a special location on any vehicle, adding a length to the coax brings the SWR down - why? Due to the "controlled conditions" the antenna was designed for, are not being met due to the ground image is changing the antennas own feed point impedance, hence SWR.

Yes, this is a special case, and has occurred to myself personally. A Wilson antenna with it's 18 feet of coax gives an SWR of 1.6 to 1.9 - kind a high but tolerable. Adding a 3-foot patch cord lowers SWR to 1.3 to 1.4 - on a Ford Aspire a sub-compact. Simply not enough ground plane image to make the antenna appear resonate. The Aspires curved roof line also affects feed point impedance - once again the real world takes it's toll on ideal antenna locations.

Francis, Firestik, K40 - all have this same problem. Antenna feedpoint impedance in certain conditions and location on the ground plane, will not be able to be tuned out.

Recommendation that the customer use a specific length of coax is not only a choice, but allows the customer the opportunity to use the antenna even though it's performance may not be ideal. As a side benefit, if the antenna performs well, using the specific length doesn't violate any particular rules - the coax sees a balanced load and doesn't play a role except for being a feed line.

A side benefit is the lack of problems if the coaxial cable ends are kept at factory stock, and sealed. They simply last longer and gives acceptable performance for a longer period of time.

:+> > All I've seen is quoting direct and verbatim from books, but not one
:+> > shred of direct evidence from the real world to back up the length
:+> > doesn't matter claims.
:+>
:+> I don't quote specific experiences because they are SINGULARITIES.
:+> Statistically, they mean almost nothing. Theory is based on countless

:+> you. You saw a coax length that appeared to matter; therefore, it
:+> matters to you and you insist to the whole world that it matters
:+> when you've got nothing but a misunderstood observation as your
:+> evidence.

And then to make a "generalized" statement about coax length does not matter is avoiding an issue regarding those special cases.

Whether it's antenna location, or mounting considerations. The failure of the customer to provide us, as installers, other locations and mounts for options - they go somewhere else. What the end result is, is a mess.

A Van or Caravan, with the whip mounted to the bumper, it's not the best spot, but this is what the customer wants. They do begin to notice the problems with both reception and receive when they try and use the radio for longer distance performance.

Each time something like the above comes into play with having to get the best out of the situation, some of the operators don't want to re-locate the antenna, just *you* tune it in better.

But! we say. It's their choice, and convincing them of another alternative is not an option.

Rule #1, customer is always right.
Rule #2, if customer is wrong - see Rule #1.

That's the point I'm trying to make. The customer isn't bringing in a '76 AMC Pacer and want a roof mount. That's stuff is easy and doesn't require any special length of coax, save one, the length to connect the radio to the antenna.

The antenna manufacturers are not as ignorant of these issues, they want to appease the customer. They are taking steps to advise the user that not everything is the same in the real world.

"Use this length" to reduce the problems is an acceptable solution to an otherwise complex problem where the customer simply cannot accept the antenna being at the location the antenna mfg suggests.

I have yet to find an antenna that works in any location you place it in. There's too many locations a good antenna can't provide a low SWR at, no matter how much time and effort you place in tuning the radiator first. There are vehicles and customers that can't, or will not, compensate the antennas requirements just to have a low SWR for a radio to be used with the antenna at a particular location - bumper and gutter mounts are one of many locations and mounts, that any antenna will have problems working properly. Be-it counterpoise, or

long-term performance.

:+>
:+> > Koax Kops haven't given anyone any methods or
:+> > techniques to try for experiements to prove that side of the story.
:+>

:+>
:+> I shoot a hole in these claims and I get no response but cheap,
:+> personal attacks like "Koax Kops will never understand."
:+> Put up or shut up. You can't do it.

See above. BTW - when you are able to follow thru on the subject of
antenna feedpoint impedance and it's role in the +/- jX factor along
with the ground image affecting the jX parameter, I believe you'll see
what I'm talking about.

To remain focused on only the antenna, you are not seeing how the
ground plane image affects the impedance of the antenna. Ground image
is directly related to how the antennas' feedpoint impedance will
appear.

If the ground is poor, we are going to see problems.

If an antenna is designed for a specific type of ground plane image in
order for it to work properly, the customer may not be able to supply
that special need for the antenna to work properly and give the
expected level of performance - let alone the low SWR.

That's where conjugate matching, IMHO, comes into play.
It's not because the antenna can't be resonate, it's because
the antenna does not have the range of impedance change the
location and counterpoise image require the antenna to have in
order to provide a low/tolerable SWR.

Note: I didn't not say, make the antenna resonate, only
appear to have a low SWR - so the radio can be used even
though performance will be poor.

And we have another problem of having to use that particular
length of coax just so the radio can work both the coax and
the antenna as one unit.

:+>
:+> > At least I don't get those results.
:+>
:+> You see. This is exactly what I said. You say (paraphrased) "I didn't
:+> see it therefore all that theory is nothing."
:+>
:+> > And yet someone can re-create these 'myths' - as the Koax Kops call
:+> > it, simply by putting up an antenna and having problems.
:+>

:+> Which "myth" are you talking about? Be specific and show us what
:+> is wrong with it -- or shut up.

See above. Also keep in mind, "location" and the ability for the
antenna to be tuneable for any impedance a poor, or otherwise
inadequate, ground plane image can throw into the equations.

:+>
:+> > By saying "Coax Length doesn't matter" doesn't resolve certain issues.
:+>
:+> Such as?
:+>
:+> Claiming that a specific length does help is not only patently false,
:+> it perpetuates a misunderstanding about RF and solves nothing.

No, it can provide a tolerable SWR for a customer that didn't want to
give the antenna what it needs, or the physical constraints that
locating the antenna in the ideal spot is not possible. So, therefore
the customer has to suffer, the fate of not being able to use the
radio, or have a choice to at least use the radio even though the
performance is not ideal.

Regards!
:+> Andy <+:

:+> tried the various experiments that I have outlined in various posts that
:+> would allow you to prove or disprove the claims I have made?

When I put to the group the conjugate for the 25ohm - j5 - only one
person made an effort, it was George.

BTW - the SWR scale for 25 to 50 ohm mis-match is not 2:1 it's closer
to 2.7:1 - 33 ohms is closer to 2:1 mis-match - why? Read about SWR
meter scaling issues regarding Logarithm, Linear and Scalar.

:+> : A dummy load doesn't radiate? LOL! Well, so much for the lossless coax
:+> : superconductor theories. We just try not to generate interference with
:+> : other stations - but we've had conversations on dummy loads before and
:+> : they are very effective for short range stealth "Snipe hunts".
:+>
:+> Sure, a dummy load radiates. If properly constructed, it radiates little
:+> or no detectable radiation. It radiates it as heat instead.
:+>
:+> The dummy loads that are commonly available do radiate a bit of rf. As
:+> you state, they can be used for Fox Hunts - not "Snipe hunts".

We're special that way, Snipe Hunts are for "troublemakers", Fox Hunts
are for gaming purposes.

:+> : And yet someone can re-create these 'myths' - as the Koax Kops call
:+> : it, simply by putting up an antenna and having problems.
:+>
:+> No, a person can do something that appears (on their SWR meter) to do
:+> something that is not happening. I posted the reasons why this occurs.

Only thing that was not stated was, the antenna made resonate or not?

Since we've had a balky server, I'd like to see the post, you can
Email it to me to save bandwidth for the group.

:+> : If you look back, and I seem to have to repeat it all the time I'm out
:+> : here, my posts are for the issue that coax length shouldn't matter you
:+> : need to fix something.
:+>
:+> Unless you are using a matching section of coax with a different impedance
:+> than the regular coax - length does not matter (except for the regular
:+> small additional attenuation you get from resistive losses in the coax.
:+>
:+> We are talking about one run of coax with a given characteristic
:+> impedance here. Matching stubs are a different matter, as they are
:+> either open or shorted at one end.

One thing that was not mentioned, was how the counterpoise will affect
an antenna designed for one particular type of image. The antenna, any
antenna, will appear non-resonate when it's using a counterpoise that
is not ideal. Does that make the antenna show a high SWR? Yes. Does it
mean the antenna is at fault? No. What it means is the antenna is
simply not resonate at the location it's in.

A good antenna will provide the bandwidth needed to adjust
it's impedance to meet the needs for low SWR, but some
people just won't abide by the antennas requirements and force
the issue of conjugate matching due to the antenna is now
placed in a non-resonate position - even though it can be
made resonate elsewhere on the vehicle or ground image.

I think we're in agreement on this - but since the servers were balky
due to spam traffic, I'll need to see that particular post.

:+> : Simple problems that generate and perpetuate the myth are actually
:+> : methods that coax properties have, and will always occur, when you use
:+> : antennas over a conductive surface that is not ideal and try to make
:+> : it work like a dipole.
:+>
:+> It does not matter if the load is bananced or not - the same rules
:+> apply. If you think that earth conductivity does not matter with
:+> dipoles, then you need to get some experience with them.

See above...my experience shows non-resonance when in proximity on a
vehicle due to poor location, but just on a pole 6 inches above the
earths surface, a 1:1 SWR can be obtained. [8 radial arms of 9 feet
using coaxial braid from mount - "dangle" of 10-12 degrees of slope to
earths surface at 9 foot mark to steel stake 3 feet into earth -
pounded flush to surface].

:+> Actually, it probably will be resonant - but the load point resistance
:+> will change, as will (most likely) the resonant frequency.
:+>
:+> : By saying "Coax Length doesn't matter" doesn't resolve certain issues.
:+>

:+> : Don't beleive me? Re-read my posts.
:+>
:+> I believe I have addressed all the issues, and explained them, in past
:+> recent posts.

I think I'll need to see that Email...

3805. Re: Coax Question

Source record: 65188

Greetings!

Sorry Doc, no reactive jX component - can't apply.

That's the difference!

If you had a reactive jX component - coax length trim can help you.

So therefore, to answer your question - you simply have a resistive
load, with no reactive elements - you will never achieve the 1:1 SWR.

Is an SWR of 1.7 acceptable?

On Sun, 24 Dec 2000 13:36:52 -0600, while the modem was ice fishing
with the Mouse, 'Doc <w5lz@oio.net> dissertation the following:

:+>
:+>
:+> Handy Andy,
:+> The same question;
:+>
:+> :+> I am still waiting to hear what (wave) length of 50 ohm coax I
:+> need
:+> to achieve a
:+> :+> 1:1 match at the radio when the antennas feedpoint impedance is 37
:+> + j0 Ohms.
:+> :+> Anyone who claims you
:+> :+> can adjust the SWR by changing length should be [able] to answer
:+> this
:+> simple, unanswered
:+> :+> question.
:+>
:+> The frequency of interest is 27.1 Mhz. What length of 50 ohm
:+> coax???
:+> 'Doc

Regards!

*Greetings!
*
*On Fri, 22 Dec 2000 21:39:58 GMT, while the modem was ice fishing with
*the Mouse, sparky@cet.com (Sparky) disseminated the following:
*
*:+> On Fri, 22 Dec 2000 15:45:29 -0500, Handy Andy <CodysPC@Iserve.Net>
*:+> wrote:
*:+>
*:+> >One thing that is not mentioned in these posts, is dealing with a
*:+> >known impedance of an antenna over a ground system.
*:+>
*:+> Well, one thing that I have _never_ seen is a 1/4 wave vertical that
*:+> measured at the ideal impedance of 36.5 ohms. Or 50 + j0, for that
*:+> matter. I very rarely see an antenna that isn't reactive to some
*:+> degree. There are just too many variables to make the definitive claim
*:+> that any given antenna "must" behave this way or that way.
*
*And it states in every antenna book that antennas HAVE reactive
*properties - they aren't perfect conductors. Tuning the antenna
*changes those properties. But the coax itself can't change it's own
*characteristic impedance - it exists.
*
*In some examples, using coaxial baluns for the matching network, you
*are using the coaxial lines inherent properties to provide a tolerable
*SWR just so the operator can get on the air even when you have a
*non-resonate antenna.
****

While baluns can obtain impedance transformation, their primary function is to
alter "bal"anced feeds to "un"balanced feeds or vice-versa. Only is specific
cases are balus used for matching and balnacing.

****
*A reciprocal event would also incur that if the antenna was tuned for
*resonance using a particular type of counterpoise, re-creation of that
*counterpoise may not always be possible in the real world. This would
*make the antenna appear to be non-resonate, even though the antenna
*could use it's reactive properties, in conjunction with, the coaxial
*lines own, to appear resonate to the radio.
****

An antenna is tuned to resonace by adjusting length or by lumpded constants at
the feed point. The feed line should never be used to resonate an antenna.

****
*Only now, we have a requirement that the antenna has to use the coax
*to provide a workable SWR for the operator to use their station.
*
*And therefore the antenna and the coax are now a single antenna, the
*feed line [read:coax] is now part of the antenna.
****

NO the coax is a conduit fro the TEM wave to travel from the transmitter to the
antenna. The coax is not part of the antenna. That is a very poor design.

****
*Granted, it's not efficient, but it is a workable solution.
*
*:+> >snip>Using a special length, we DO cancel out unwanted
*:+> >reactance [and is why they simply avoided the [25ohm - 5j or - j5]
*:+> >equation - you can get an antenna to show lower SWR when the reactive
*:+> >component is a higher value.
*:+>
*:+> The reality is that sometimes even just moving the coax can change the
*:+> SWR, possibly due to radiation being absorbed by the shield, or even
*:+> proximity to a ferrous surface. You just can't tell until you get out
*:+> there and do it.
*
*Exactly, it's not a possibility it's a fact. The coax is now part of
*the antenna system and the field around the antenna is also being
*absorbed into the coaxial outer shield - and why I am suggesting to
*the "Koax Kops Kopys" that are out here that they have no basis for
*forcing such issues in the real world. The real world simply does not
*work that way.
*And is why I suggest in vehicle mounting and installs, "mount the
*radio to metal inside the vehicle". Just for the purpose of RF having
*somewhere to return to without having to use the coax to accomplish
*it.
*
****

The outer shield can be in the field of the antenna, but that by itself does not
preclude that some current will be induced into the outer shield by that RF
field. Yes the chasis of the radio should always be returned to ground by the
shortest path posible. Relying sometimes on the power cord alone may not be
suffiecient. If you rely on the shield of the coax to provide DC ground to the
radio then you are asking for all kinds of problems.

****
*Fixing the problem for a customer is not hard, but if the customer
*wants it just the way it is, we have to abide by their wishes.
****

Yep if they want junk hten let t hem have junk.

****
*Don't worry, I did fix the problem in the above example. The solution

*was to replace the coax, put on a new PL259, and the kid is fine and
*happy with it, even though the mount has a little rust and uses 18' of
*coax [LOL]!
****

damaged coax and/or conncetors are most problematic items in mobile
installations.

****
*:+> >What could have cornered them, and what was eventually being discussed
*:+> >but was later avoided [that was the hint] was the coaxial dipole and
*:+> >how they wanted to know about radiating coax.
*:+>
*:+> They would have just denied it. No point.
*
*It's a shame that "Koax Kops Kopys" will never get to understand that
*there is a more important function that coax exhibits. It's something
*that you *can't* change, and that is it's own reactive properties.
*
*Tuning an antenna is one thing, coax can't change - that seems to be
*the hardest part they don't understand. Are we supposed to change the
*coaxial line to something that fits when we have a problem? I thought
*we were supposed to tune the antenna first, or is what we all agree
*to? <It's what makes this whole thread so humorous.>
*
*If you find a sale on 36.5 ohm coax, could you pass that along?
****
Tuning the antenna is the best method. Problem is that most antenna do not have
sufficient tuning range for all possible situations. Should never ahve toworry
about the coax length.

How much 36.5 Ohm coax do you wnat? Take two equal lengths of 75 Ohm coax in
parallel and you have 37.5 Ohm coax. If you want 25 Ohm coax do the same as
above for 50 Ohm.

james

*[LOL]
*
*
*:+> >Thats why I posted conjugate match. They can't get past the fact that
*:+> >the antenna is no longer "the antenna" - both the coax and the antenna
*:+> >are now a single unit. And depeding on how the coax is used, can be
*:+> >the "shorting stub" [open end] or the antenna itself can be the
*:+> >"tuning stub" used with this given length of coax.
*:+>
*:+> The shield can indeed radiate when, as you say, it becomes part of the
*:+> antenna system. This is not always desired or forseen, but it happens.
*:+> And here's another one for the notebook: When there is RF on the
*:+> shield, and when that RF is choked short of a multiple of a 1/4 wave
*:+> from the antenna, you will get harmonics. Sometimes the choke doesn't
*:+> have do be much, such as close proximity to ferrous materials, or just

*:+> a kink in the coax. That's why it is good practice to wind excess coax
*:+> in a figure-8, not a coil.
*
*So why are the "Koaxial Keystone Kops Kopys" quad-K's ;-> having such
*a hard time understanding this issue?
*
*It's something that a customer wants. We have no choice as installers.
*Even though the real solution is known - the customer doesn't want it
*fixed, it's working fine!
*
*Gosh, not to sound insulting, I would just fix the problems and be
*done with it. I don't know what all the fuss is about...?
*
*In regards to harmonics, - I've seen this, it acts like a wave trap.
*
*The antenna, being reactive, does add it's own reactance and change,
*or alter, the waveform when you are dealing with a reactive system
*like what I've experienced in your example above. Energy is reflected,
*as to what levels depends on the determinant jX factor.
*
*This might help shed some light on that subject.
*
*Some CB radios' in their output network, have a 52-54MHz trap/low pass
*filter using a particular wind and capacitance to supposedly attenuate
*this.
*
*Problem though, it has a high impedance to arrival of these waves as a
*part of noise filtering done for the purpose of input tuning to help
*lessen receiver noise. As the harmonics that got past the network
*return to the radio, they are not attenuated, so it re-reflects.
*
*When you have radiating coax like in the above example - the radio
*itself doesn't reflect or attenuate harmonics in the power to the coax
*properly, it forms a tuned circuit using the network inside both the
*radio the coax. The radio will actually refuse to attenuate the
*harmonics that originally passed thru the network into the coax, as
*the antenna appears as a high impedance to this, it reflects this back
*to the radio, and the radio's network doesn't attenuate the harmonics
*- ad verbatim, and the coaxial line is forced to lose this somehow as
*a loss.
*
*A field is generated around the coax at this point, and it's simply
*due to the antenna and the radio don't want it. The coax is then
*forced to lose this energy and hence a harmonic problem.
*
*There are CB radios that have the 52-54MHz filter that works right.
*
*You can check for this using a MFJ-259B and see how the radio will
*react with the 52-54MHz trap by putting the MFJ right to the end of
*the radio with a coax patch cord. It makes an interesting view of just

*what goes on back there.
*
*
*:+> >I hope this helps you, and I'm simply letting you know that you are a
*:+> >good source of information about antennas. I'm impressed with not only
*:+> >how you conducted yourself, but your knowledge. If you have a web page
*:+> >or two, I would like to link my pages about CB radio installations to
*:+> >yours to help provide more information.
*:+> >
*:+> >Would you be interested?
*:+>
*:+> I have a web page, but it has little if nothing to do with CB radio.
*:+> It deals more with my dabbling in that lowfer stuff, 160 - 190 KHz.
*:+> It's more of a challenge to get a clean signal out with just one watt
*:+> and a non-resonant antenna. It's a band for people that know what they
*:+> are talking about, not for Koaxial Keystone Kops.
*
*Email me the URL I'd like to take a look at it, please. I'd like to
*see your efforts on this. Sounds interesting.
*
*Sometime, I'd like to demonstrate a "coffee can" antenna - a mag-mount
*and a random length of coax, with a PL-259 connector on a coffee can.
*And this does provide an 1:1 SWR.
*
*A CB'er showed me that trick, "unbelievers" *should understand* that
*even when you use a specific length of coaxial line, the mounting
*location and counterpoise for a CB is what makes this system work to
*determine SWR and how low this ratio will go. Leave it to a CB'er!
*LOL!
*
*
*Regards!

I really don't believe this guy.

Does he really comprehend what he reads or does he look through rose collered glasses?

On Sat, 23 Dec 2000 21:33:13 -0500, Handy Andy <CodysPC@Iserve.Net> wrote:

*Greetings!
*
*Doc, you're reading the wrong group! That must be your problem, we're
*here in rec.radio.cb, are you cross posting?
*
*Doc, show me a man that believes "Coax length doesn't matter" and I'll
*show you "A man that has no experience in putting any radio system
*together."
****

I do not know anything about you or really care to either. But I would be very careful about the above statement. I have been on CB and amatuer radio for over thirty years now and have been through a lot of setups and installations. And for only specific cases, does the length of coax matter. Q-sections are the exception to the rule.

****
*There's too many variables in real life to simply discard the fact
*that coax does what it does. It simply reacts to a reactive load.
****

There are very few variables in coax. Most of them are dealing with the load.

****
*All I've seen is quoting direct and verbatim from books, but not one
*shred of direct evidence from the real world to back up the length
*doesn't matter claims when real world events place their variables
*into these setups.
****

Simply you need to understand what a transmission line is and what an antenna is. Then most of the expalnations given will make sense.

****
*Koax Kops haven't given anyone any methods or techniques to try for
*experiments to prove that side of the story. At least I don't get
*those results - it's formulas, no testing the theories. I get results
*similar to events that I am discussing here - are you on the same page
*as everyone else?
*

*A dummy load doesn't radiate? LOL! Well, so much for the loss less
*coax superconductor theories. We just try not to generate interference
*with other stations - but we've had conversations on dummy loads
*before and they are very effective for short range stealth "Snipe
*hunts".
*
*I'll reiterate..
*:If coax length didn't work like it does when antennas are not resonate
*:due to problems with poor ground images on one location - steps need to
*:be taken to fix the problem - either by re-locating the antenna or
*:improving ground image area by fixing the mount connections.
****

yes it is true by moving the antenna or fixing the mount, antenna impedance is
altered. This is a direct affect on the antenna only. The coax is unaffected.
The change in antennas impedance wil have a direct bearing on SWR.

****
*And yet someone can re-create these 'myths' - as the Koax Kops call
*it, simply by putting up an antenna and having problems.
*
*If you look back, and I seem to have to repeat it all the time I'm out
*here, my posts are for the issue that coax length shouldn't matter,
*you need to fix something.
*
*Don't believe me? Re-read the posts. See the statement ":" above. That
*is where I stand on this issue, no one can change that.
*
*Simple problems that generate and perpetuate the myth are actually
*methods that coax properties have, and will always occur, when you use
*antennas over a conductive surface that is not ideal and try to make
*it work like a dipole.
*
*"There's two sides to every element" means just that - you need the
*other half of the image to make the system work. When it's not ideal,
*no antenna that is resonate on one particular ground will be able to
*be resonate on all types of surfaces.
****

I think yo need to go back an dreread some of those books you have been reading.
This time try and comprehend what they mean. Yes a 1/4 wave antenna needs ground
to complete the missing part. But that will happen regardless of coax length.
You cannot alter the antenna image by coax length. The losses incured by poor
ground affects the efficiency of the antenna. In some cases it can alter the
feed impedance.

****
*By saying "Coax Length doesn't matter" doesn't resolve certain issues.
****

matching the antenna to the desired impedance of the antenna is the ultamate
goal. Antennae generally have some means of doing that. All antennae will not

work the same on any location on any vehicle. In some cases there is not suffiecient adjustments for a particular antenna on a particualr vehicle in a particular location. This is due in part because of the antenna and the vehicle itself. Now adjusting the coax until the SWR meter reads 1:1 makes the meter happy. It in no ways corrects the problem at the antenna. The eficiency of the antenna is not improved because the mismatch at the antenna to the coax still exists. There has been a lot of good information given on this thread. Coax length will never change the mismatch at the antenna/coax boundary. If your sole goal is to show a unknowning customer that the SWR meter on his radio will read 1:1 with coax length, then have at it. Just don't try and justify it here.

Someday there maybe hope for you Andy. I just hope I live long enough to see that day.

james

I've tried three times to post a for sale radio and it ain't making it too the group. How can this be? Seems as though if I put the radio in the subject header or just FS there, it does not make it. Friggin weird, man. All my tests have made it as you have most likely seen (sorry). Friggin wierd...
Let's see if this gets through...

I'm sorry, but this is a common misconception. Coax cables are not
resistors, and product-over-sum doesn't work. Two identical coax
cables in parallel split the power, i.e, each coax carries half the
voltage _and_ half the current. The ratio is the same, and so is the
impedance. This is very easy to verify by experiment.

Doc,

Your vigorous and maligned defence of your alias is really entertaining, but heavily misdirected. If you think that I'm a bore, then don't read my future posts, as you have not read my previous ones. If you had read them then you would know that I have answered the question posed by the OP more than once.

Everything that I have stated has come from both theory and experience, and I have disclosed my credentials. Neither you nor your rent-a-cop have done so. I have provided a solid reference, but CLP disputed his only reference, and claimed he would dispute any reference that didn't conform to his own theories. In that light, there is really no reason to continue any discussion with him or you. Regardless:

(The second closest thing to a legitimate reference by CLP.)

>I believe you have either mis-"summarized" or used text that is
>entirely out of context.

>I'll get your book. We'll settle this.

On his own volition he made this statement, euphemistically calling me a liar. He hasn't followed through on his stated intent to support this accusation, because if he did he would have been forced to admit that he is wrong. It is clear that he would rather ignore the facts, discredit the authorities, and subvert all logic in order to claim victory, even when there is no competition. That's entertainment.

Until it happens that you obtain my reference and prove his allegation, you don't have much to say about what is relavent in my discussion with CLP.

: *are using the coaxial lines inherent properties to provide a tolerable
: *SWR just so the operator can get on the air even when you have a
: *non-resonate antenna.
: **********

: While baluns can obtain impedance transformation, their primary function is to
: alter "bal"anced feeds to "un"balanced feeds or vice-versa. Only is specific
: cases are balus used for matching and balnacing.

To be more precise, there are three primary purposes for a balun:

1) converting to/from an unbalanced situation to a balanced situation
2) impedance transformation, such as using a 6:1 balun to go from a 50
ohm feeder to a 300 ohm antenna
3) suppression of common mode currents on the outside of coax (using a
choke balun - although calling it a balun is probably stretching the
definition a bit).

: **********
: *A reciprocal event would also incur that if the antenna was tuned for
: *resonance using a particular type of counterpoise, re-creation of that
: *counterpoise may not always be possible in the real world. This would
: *make the antenna appear to be non-resonate, even though the antenna
: *could use it's reactive properties, in conjunction with, the coaxial
: *lines own, to appear resonate to the radio.
: **********

: An antenna is tuned to resonace by adjusting length or by lumpded constants at
: the feed point. The feed line should never be used to resonate an antenna.

The added reactances can be added elsewhere besides the feed point, such as
with a top hat or center-loaded whip. Distributed reactances may also be
used.

: **********
: *Only now, we have a requirement that the antenna has to use the coax
: *to provide a workable SWR for the operator to use their station.
: *
: *And therefore the antenna and the coax are now a single antenna, the
: *feed line [read:coax] is now part of the antenna.
: **********

: NO the coax is a conduit fro the TEM wave to travel from the transmitter to the
: antenna. The coax is not part of the antenna. That is a very poor design.

Correct, but it happens - more frequently than many people would think.
It probably is responsible for most of the misunderstanding about changing
coax line lengths when a mismatch is present. I suspect that almost all
CB and Ham mobile rigs have the outer part of the shield acting as part
of the antenna system - to some degree.

Source record: 65362

Handy Andy <CodysPC@iserve.net> wrote:

: And this is what makes it difficult to understand the "total" issue of
: the stance that "coax doesn't matter".

: A simple case is those that purchased such antennas like those for CB,
: both Francis, and Wilson, recommend a specific length to avoid issues.

The usual claim is that changing the coax length will change the SWR that is on the coax. To CBers, and some Hams, a low indicated SWR is the only acceptable situation. As long as they can get that indication down to the magical 1:1 on their meter, they believe that everything is now perfect with their system and that it cannot be made to perform better. Further, they perpetuate the myth that 18 feet of coax will minimize SWR - where it is actually one of the worst lengths you can use - as it maximizes the rf currents that may appear on the outside of the coax, turning the coax into a radiator (not generally desired).

This is what the people who understand transmission lines here have been objecting to - as changing the length of the coax will NOT affect the SWR in the coax. It may make the transmitter load into the coax better, as coax length will affect the input impedance if there is a mismatch. That is also probably why Wilson and Francis recommend specific coax lengths. I wonder if they consider the velocity factor of the coax?

Changing coax length may also affect what the SWR meter indicates, for the reasons I have posted earlier. But that is one of those cases of "appears to occur".

: One specific issue is being that location plays a role in the actual
: impedance the antenna will exhibit at a point.

Which is part of tuning the antenna. It does not affect the impedance of the coax.

: While tuning the antenna is the preferred and often the most
: successful - we have another problem where the customer wants the
: antenna put on only one way, and one location.

: This is where the choice is lost. We, as installers, simply
: have no choice here. So what does the customer do? It's none
: of our business, but that is where the problems lie. They
: claim that trimming the coax, or having to run a certain
: length
: works and is being told to their friends.

: Yes, I agree, this is a special case, but why flame those that
: do agree unless it's such a special case as above?

So, do it their way. But don't turn around and claim that the length
of the coax does not matter - if you know better.

: Case and point is the fact that antennas for CB, or any particular
: type designed using a "test range" or controlled conditions, will
: require the purchaser to recreate the ground image as stated in the
: antennas own instructions manual for the antenna to provide the
: expected level of performance - and low SWR.

Again, that has no effect on the coax. You are tuning the antenna.

: If an antenna is designed, tested, wrapped, sold with the
: recommendations on the placard for a specific length, there are
: reasons for that. It was designed to give a particular type of
: performance using the ideal ground plane the antenna was originally
: designed for. If the counterpoise requirements can't be met, at least
: you'd see the coaxial impedance the antennas reactive properties will
: conjugate to and "fool" the meters into showing a tolerable SWR. This
: doesn't mean they have a 1:1 or so SWR, they have a tolerable SWR the
: radio can handle.

: Wilson, claims that if you place one of their antennas on
: a vehicle that is a sub-compact, or in a special location
: on any vehicle, adding a length to the coax brings the SWR
: down - why? Due to the "controlled conditions" the antenna
: was designed for, are not being met due to the ground image
: is changing the antennas own feed point impedance, hence SWR.

Because they know the CBer (or Ham) would be less likely to accept their
antenna if they told them that only the indicated SWR would come down,
but the actual SWR would not change. The customer would buy someone elses
antenna instead.

They might also recommend a specific length for the reason I mentioned
above - matching the input impedance of the coax to the radio.

: Yes, this is a special case, and has occurred to myself
: personally. A Wilson antenna with it's 18 feet of coax gives
: an SWR of 1.6 to 1.9 - kind a high but tolerable. Adding a
: 3-foot patch cord lowers SWR to 1.3 to 1.4 - on a Ford Aspire
: a sub-compact. Simply not enough ground plane image to make
: the antenna appear resonate. The Aspires curved roof line also
: affects feed point impedance - once again the real world takes
: it's toll on ideal antenna locations.

But that still does not affect the SWR, even if it appears to do so.

: Francis, Firestik, K40 - all have this same problem. Antenna
: feedpoint impedance in certain conditions and location on the
: ground plane, will not be able to be tuned out.

: Recommendation that the customer use a specific length of
: coax is not only a choice, but allows the customer the
: opportunity to use the antenna even though it's performance
: may not be ideal. As a side benefit, if the antenna performs
: well, using the specific length doesn't violate any particular
: rules - the coax sees a balanced load and doesn't play a
: role except for being a feed line.

The coax will never see a balanced load with a mobile antenna. It
cannot, as the load is not balanced. They could just as well use the
antenna without the extra length, and it would perform just as well.

: A side benefit is the lack of problems if the coaxial cable
: ends are kept at factory stock, and sealed. They simply last
: longer and gives acceptable performance for a longer period
: of time.

Varying the length of coax has no effect here.

: :+> of observations; there must be an explanation. But that doesn't stop
: :+> you. You saw a coax length that appeared to matter; therefore, it
: :+> matters to you and you insist to the whole world that it matters
: :+> when you've got nothing but a misunderstood observation as your
: :+> evidence.

: And then to make a "generalized" statement about coax length does not
: matter is avoiding an issue regarding those special cases.

It may matter to the customer. It may matter to you, as you want to
keep the customer happy. But functionally, it does not matter.

: Whether it's antenna location, or mounting considerations. The failure
: of the customer to provide us, as installers, other locations and
: mounts for options - they go somewhere else. What the end result is,
: is a mess.

: A Van or Caravan, with the whip mounted to the bumper, it's not the
: best spot, but this is what the customer wants. They do begin to
: notice the problems with both reception and receive when they try and
: use the radio for longer distance performance.

Usually, they don't "notice" any problem until they put a Rat Shack
SWR meter in line and notice that there is not a perfect match.

: Each time something like the above comes into play with having
: to get the best out of the situation, some of the operators
: don't want to re-locate the antenna, just *you* tune it in
: better.

: But! we say. It's their choice, and convincing them of another
: alternative is not an option.

: Rule #1, customer is always right.
: Rule #2, if customer is wrong - see Rule #1.

: That's the point I'm trying to make. The customer isn't bringing in a
: '76 AMC Pacer and want a roof mount. That's stuff is easy and doesn't
: require any special length of coax, save one, the length to connect
: the radio to the antenna.

: The antenna manufacturers are not as ignorant of these issues, they
: want to appease the customer. They are taking steps to advise the user
: that not everything is the same in the real world.

No, they are perpetuating a myth, just to make the customer happy.

: "Use this length" to reduce the problems is an acceptable solution to
: an otherwise complex problem where the customer simply cannot accept
: the antenna being at the location the antenna mfg suggests.

Maybe the installer's problems. It does no actual good - except makes
the customer feel better.

: I have yet to find an antenna that works in any location you place it
: in. There's too many locations a good antenna can't provide a low SWR
: at, no matter how much time and effort you place in tuning the
: radiator first. There are vehicles and customers that can't, or will
: not, compensate the antennas requirements just to have a low SWR for a
: radio to be used with the antenna at a particular location - bumper
: and gutter mounts are one of many locations and mounts, that any
: antenna will have problems working properly. Be-it counterpoise, or
: long-term performance.

I assume you mean by "not working properly" to mean that the customer
can measure a non-perfect match, then I agree. If you mean that the
antenna is not working properly because the SWR is 1:6.1 instead of
1:1, then I disagree.

... deleted ...

: To remain focused on only the antenna, you are not seeing how the
: ground plane image affects the impedance of the antenna. Ground image
: is directly related to how the antennas' feedpoint impedance will
: appear.

The ground losses affect the antenna impedance, true. You certainly
want to minimize such loss, as it becomes heat - not radiated signal.

But why do you want to get a 50 ohm impedance, if the antenna when
it is resonant is (for example) 35 ohms? Do you want to increase the
ground losses to 15 ohms, so you will get a perfect match, or would
you rather have the ground losses at 5 ohms, and see some SWR?

As a hint, the efficiency of the antenna is the antenna impedance
divided by the total impedance.

Calculate 35/40 and 35/50 and see.

: If the ground is poor, we are going to see problems.

Maybe.

: If an antenna is designed for a specific type of ground plane image in
: order for it to work properly, the customer may not be able to supply
: that special need for the antenna to work properly and give the
: expected level of performance - let alone the low SWR.

: That's where conjugate matching, IMHO, comes into play.
: It's not because the antenna can't be resonate, it's because
: the antenna does not have the range of impedance change the
: location and counterpoise image require the antenna to have in
: order to provide a low/tolerable SWR.

See above about low SWR.

: Note: I didn't not say, make the antenna resonate, only
: appear to have a low SWR - so the radio can be used even
: though performance will be poor.

It can be used even with what a CBe,r or many Hams, would consider
"high SWR" - and possibly better than with the low SWR.

If the antenna is not resonant, it is NOT performing at its best.

: *And* we have another problem of having to use that particular
: length of coax just so the radio can work both the coax and
: the antenna as one unit.

I have never seen a CB antenna where the length of coax mattered. The
coax/antenna work together exactly the same, no matter what you do to
the coax length. The radio only sees the input impedance to the coax,
it does not even know that an antenna is at the other end.

You may get slightly better coupling from the radio to the coax by
changing the coax length, but that is all.

: :+> Which "myth" are you talking about? Be specific and show us what
: :+> is wrong with it -- or shut up.

: See above. Also keep in mind, "location" and the ability for the
: antenna to be tuneable for any impedance a poor, or otherwise
: inadequate, ground plane image can throw into the equations.

Coax length will not affect the impedance of the antenna, nor do
anything for a poor ground plane.

: :+> Claiming that a specific length does help is not only patently false,
: :+> it perpetuates a misunderstanding about RF and solves nothing.

: No, it can provide a tolerable SWR for a customer that didn't want to
: give the antenna what it needs, or the physical constraints that
: locating the antenna in the ideal spot is not possible. So, therefore
: the customer has to suffer, the fate of not being able to use the
: radio, or have a choice to at least use the radio even though the
: performance is not ideal.

No, the customer would have to suffer learning that he had believed
a myth all these years. If you have a CB antenna that you cannot tune

to under a 2:1 SWR, no matter where you place it on the vehicle, then
you have a defective antenna.

:>that require 18' of coax have no basis in fact.

: I'll have to disagree here. Parallel currents can produce a bad
: termination for the transmitter. A proper choice of coax length
: won't remove these currents but will reduce the SWR measurement
: at the transmitter. Thus creating a better load for the transmitter.

The SWR reading at the rig may be reduced - for the reasons I have
posted previously. But it will not reduce the common mode currents
due to SWR - those will remain the same regardless of the length of
the coax.

What can be affected are common mode currents that are coupled to
the coax from the signal radiated by the antenna. But 18 feet is
one of the WORST lengths that you can use for that, as it maximizes
such signal coupling - hint, it is a resonant half-wave.

:>2) Even if you found a length of coax that did reduce your common mode
:>current problem, it would be a poor solution. There are several good
:>ways to attack this problem; varying the coax length is not one of them.

: I'll agree that the best solution is to eliminate parallel currents.
: However from a manufacturers standpoint he knows that there
: will be some installations that induce unwanted parallel currents.
: If this is the case then 18 feet will best mask a parallel current
: problem. That is why Wilson, Firestik and others will specifically
: call out the 18 foot length.

See above. "Mask" is the proper term.

: :+>
: :+> No, a person can do something that appears (on their SWR meter) to do
: :+> something that is not happening. I posted the reasons why this occurs.

: Only thing that was not stated was, the antenna made resonate or not?

It does not matter if the antenna is resonant or not. You are unlikely
to get a valid SWR reading on any meter if common mode currents exist
on the coax. For almost all CB and many Ham installations, this will be
the case.

: :+> We are talking about one run of coax with a given characteristic
: :+> impedance here. Matching stubs are a different matter, as they are
: :+> either open or shorted at one end.

: One thing that was not mentioned, was how the counterpoise will affect
: an antenna designed for one particular type of image. The antenna, any
: antenna, will appear non-resonate when it's using a counterpoise that
: is not ideal. Does that make the antenna show a high SWR? Yes. Does it

: mean the antenna is at fault? No. What it means is the antenna is
: simply not resonate at the location it's in.

More correctly, the resonant frequency of the antenna may be shifted somewhat by the non-ideal counterpoise. Absolutely made non-resonant, no way. The counterpoise can also affect the feed point impedance of the antenna. The latter can affect the resonant SWR. A poor counterpoise can also increase the "ground resistance" of the system, reducing the efficiency of the antenna - while at the same time it might actually improve the SWR.

: :+> : Simple problems that generate and perpetuate the myth are actually
: :+> : methods that coax properties have, and will always occur, when you use

I used the word "mask" to confirm what I said earlier. 18 feet
won't remove parallel currents, but it will reduce the effects of
them on the transmitter. A beneficial masking, particularly from
a manufacturers standpoint.

Greetings!

Will clarify as we go...

On 26 Dec 2000 10:32:35 GMT, while the modem was ice fishing with the
Mouse, Bill Nelson <billn@spock.peak.org> dissertation the following:

:+> Handy Andy <CodysPC@iserve.net> wrote:

:+> : A simple case is those that purchased such antennas like those for CB,
:+> : both Francis, and Wilson, recommend a specific length to avoid issues.
:+>
:+> The usual claim is that changing the coax length will change the SWR that
:+> is on the coax. To CBers, and some Hams, a low indicated SWR is the only
:+> acceptable situation. As long as they can get that indication down to the
:+> magical 1:1 on their meter, they believe that everything is now perfect
:+> with their system and that it cannot be made to perform better. Further,
:+> they perpetuate the myth that 18 feet of coax will minimize SWR - where
:+> it is actually one of the worst lengths you can use - as it maximizes
:+> the rf currents that may appear on the outside of the coax, turning the
:+> coax into a radiator (not generally desired).
:+>
:+> This is what the people who understand transmission lines here have been
:+> objecting to - as changing the length of the coax will NOT affect the
:+> SWR in the coax. It may make the transmitter load into the coax better,
:+> as coax length will affect the input impedance if there is a mismatch.
:+> That is also probably why Wilson and Francis recommend specific coax
:+> lengths. I wonder if they consider the velocity factor of the coax?
:+>
:+> Changing coax length may also affect what the SWR meter indicates, for
:+> the reasons I have posted earlier. But that is one of those cases of
:+> "appears to occur".

I realize that it is their objection, but there are problems in trying
to accommodate those that feel it doesn't matter. There is a world of
people and their needs that make the "ideal" antenna offerings nearly
impossible to accommodate all people, all the time.

My apologies to those that feel coax length doesn't matter.
They should understand that a customer is the one that wants
the proverbial "1:1" SWR with a particular antenna and at the
location they choose. Not the other way around where the
location plays a major role in what the antenna wants.

If you come across those kinds of people, you'll know what I
mean.

And "Apparent" SWR is what we get. What I believe in, is to make these customers happy. "Apparent" versus "true" can make or break a system. If there are nay questions, remember the customer is always right.

As far as velocity factor, Wilson wants it's coax to be replaced with the same type RG-8x - and since it's what they use - I believe you are correct.

:+> : One specific issue is being that location plays a role in the actual
:+> : impedance the antenna will exhibit at a point.
:+>
:+> Which is part of tuning the antenna. It does not affect the impedance
:+> of the coax.

Again in agreement. For clarity, my own setups don't require a specific length, nor any of the installs that a customer wants the best and is willing to accept a hole being drilled for permanent mounting. Those are the easy ones.

The hard ones are the customers using a particular mount and antenna type at the location they choose. It's not my choice.

:+>
:+> : While tuning the antenna is the preferred and often the most
:+> : successful - we have another problem where the customer wants the
:+> : antenna put on only one way, and one location.
:+>
:+> : This is where the choice is lost. We, as installers, simply
:+> : have no choice here. So what does the customer do? It's none
:+> : of our business, but that is where the problems lie. They
:+> : claim that trimming the coax, or having to run a certain
:+> : length
:+> : works and is being told to their friends.
:+>
:+> : Yes, I agree, this is a special case, but why flame those that
:+> : do agree unless it's such a special case as above?
:+>
:+> So, do it their way. But don't turn around and claim that the length
:+> of the coax does not matter - if you know better.

Anylength is suggesting the idea. I merely state that if the install is done correctly, coax length is not needed. "Homework" was the word I used at the beginning of this thread.

:+> : Case and point is the fact that antennas for CB, or any particular
:+> : type designed using a "test range" or controlled conditions, will
:+> : require the purchaser to recreate the ground image as stated in the
:+> : antennas own instructions manual for the antenna to provide the
:+> : expected level of performance - and low SWR.
:+>
:+> Again, that has no effect on the coax. You are tuning the antenna.

Some antennas simply don't have the range of tuning in the scenarios
of inadequate ground plane. That is where the "coax length" issue
comes up - the antenna is not resonate, due to image, so conjugate
comes into play, and you're stuck with a poor performing system until
you can fix the problem of location and provide for the antennas
needs.

Now, I don't remember mentioning this makes the antenna
"resonate" - it's simply not the case. The coax and the
antenna have to work together now - as one unit.

:+> Because they know the CBer (or Ham) would be less likely to accept their
:+> antenna if they told them that only the indicated SWR would come down,
:+> but the actual SWR would not change. The customer would buy someone elses
:+> antenna instead.
:+>
:+> They might also recommend a specific length for the reason I mentioned
:+> above - matching the input impedance of the coax to the radio.

The fooling of the SWR meter - we are in agreement here. The customer
doesn't care about coax lengths, they want a low SWR - you'll find
extremists in every realm. ;-)

:+>
:+> : Yes, this is a special case, and has occurred to myself
:+> : personally. A Wilson antenna with it's 18 feet of coax gives
:+> : an SWR of 1.6 to 1.9 - kind a high but tolerable. Adding a
:+> : 3-foot patch cord lowers SWR to 1.3 to 1.4 - on a Ford Aspire
:+> : a sub-compact. Simply not enough ground plane image to make
:+> : the antenna appear resonate. The Aspires curved roof line also
:+> : affects feed point impedance - once again the real world takes
:+> : it's toll on ideal antenna locations.
:+>
:+> But that still does not affect the SWR, even if it appears to do so.

Another point, I've never claimed during the thread that we are tuning
the antenna due to trimming coax. We are simply providing a lower
working SWR - doesn't mean the antenna is resonate, we now have a
requirement that a length of coax is needed to show a low SWR to the
radio.

I guess this is where the interpretations go awry. My web pages
describe the need for location to play a major role in how well an
antenna will work. I don't tell people to use conjugate match to lower
the appearance of SWR unless there are problems that can't be fixed
due to location, and/or the ground image at the location, are poor.
The pages also state that you will have to use this method all the
time and the antenna performance will suffer.

:+>
:+> : Francis, Firestik, K40 - all have this same problem. Antenna
:+> : feedpoint impedance in certain conditions and location on the
:+> : ground plane, will not be able to be tuned out.

:+>
:+> : Recommendation that the customer use a specific length of
:+> : coax is not only a choice, but allows the customer the
:+> : opportunity to use the antenna even though it's performance
:+> : may not be ideal. As a side benefit, if the antenna performs
:+> : well, using the specific length doesn't violate any particular
:+> : rules - the coax sees a balanced load and doesn't play a
:+> : role except for being a feed line.
:+>
:+> The coax will never see a balanced load with a mobile antenna. It
:+> cannot, as the load is not balanced. They could just as well use the
:+> antenna without the extra length, and it would perform just as well.

The topic of low SWR though, is important to a point - I can agree to
the above. The low SWR for the operator allows them to use the antenna
on a greater number of channels.

Some antennas - especially the short ones, don't have the
bandwidth for tuning out the unwanted reactive components
so the operator has this particular problem of having to
use a required length stated by the manufacturer in order to
use the system. Not my choice here - the customers!
:+>
:+> : A side benefit is the lack of problems if the coaxial cable
:+> : ends are kept at factory stock, and sealed. They simply last
:+> : longer and gives acceptable performance for a longer period
:+> : of time.
:+>
:+> Varying the length of coax has no effect here.

But the failure rate of non-factory PL-259 ends makes the antenna fail
at inopportune times. Simply due to water entry and corrosion.
Pre-molded ends reduce these factors for a greater period of time -
less maintenance.

Which brings up the question, if the antenna is resonate at
the location - then any length of coax will work?

I agree to the above.

I suggest the use of the Pre-molded and sealed factory ends
to provide the better contacts for the extremes of weather,
salt, sun and corrosion for a longer period of time.

The above means that, if it works, don't fix it - messing
around with trimming can lead to more problems, even if all
they wanted to do was remove the slack in the cord.

:+> : :+> of observations; there must be an explanation. But that doesn't stop
:+> : :+> you. You saw a coax length that appeared to matter; therefore, it
:+> : :+> matters to you and you insist to the whole world that it matters
:+> : :+> when you've got nothing but a misunderstood observation as your
:+> : :+> evidence.

:+>
:+> : And then to make a "generalized" statement about coax length does not
:+> : matter is avoiding an issue regarding those special cases.
:+>
:+> It may matter to the customer. It may matter to you, as you want to
:+> keep the customer happy. But functionally, it does not matter.

Once again, in agreement - I don't do this stuff to my own setups - I know better. The customer is the problem, they don't have the time to understand what we talk about here on the NG regarding this topic.

Hint, an Expedition, $30,000.00 + vehicle, and they want mirror mounts. Co-phased as well. You think I'm going to argue? This customer is the one that certainly has the income but no understanding of what coax length means.

They just want to talk on their CB radio - no problem here!

:+> : A Van or Caravan, with the whip mounted to the bumper, it's not the
:+> : best spot, but this is what the customer wants. They do begin to
:+> : notice the problems with both reception and receive when they try and
:+> : use the radio for longer distance performance.
:+>
:+> Usually, they don't "notice" any problem until they put a Rat Shack
:+> SWR meter in line and notice that there is not a perfect match.

Or use their radios own "built-in SWR meter".

A typical conversation from the customer that brings it back...

"I thought you said this thing was tuned!"

"It was when it left the shop."

"Check it again" [So we check using the customers stuff]

"What SWR reading is acceptable? An SWR of 1.7 is not going to hurt."

"I want a flat match."

Well, so now what? We fix the problems - and in some cases, swapping to a different length of coax to give the customer what they want is done. No choice, just fix the problems and no, the customer isn't going to say "put it up there". Instead we *have* to fix it at the current location.

There are very few cases where the customer realizes the mistake and in those cases, we go all out and fix the problems for free - glad to know that the customer made up their minds and wants the antenna in a better spot.

:+>
:+> : The antenna manufacturers are not as ignorant of these issues, they
:+> : want to appease the customer. They are taking steps to advise the user

:+> : that not everything is the same in the real world.
:+>
:+> No, they are perpetuating a myth, just to make the customer happy.

Isn't that important? The customer is #1 - the bread and butter of the company. Now, if you mean short sheeting the customer to tune out and give an apparent SWR reading - that's short sighted practice. I've been treated that way before. Customers are not dumb. Ignorant - perhaps, but not dumb. The customer is told what we do, if it's acceptable - we proceed.

:+>
:+> : "Use this length" to reduce the problems is an acceptable solution to
:+> : an otherwise complex problem where the customer simply cannot accept
:+> : the antenna being at the location the antenna mfg suggests.
:+>
:+> Maybe the installer's problems. It does no actual good - except makes
:+> the customer feel better.

An installer does what the customer wants. Whether it means a 2 foot Firestick on a Mirror mount, a 102" on the bumper, or a mag-mount on the hood, we have to do what they ask - negotiation may be possible, but the customer will go somewhere else if they get frustrated.

Some customers do what they want, and then come back and complain "this mount" or "that antenna" is bad. We didn't install it, they bought it and are now returning it.

The above is a lost sale, simply put.

The customer gave up without even trying, let alone asking. [perhaps they're Dutch and don't want to spend $$$ needed to create a working system.]

:+> : I have yet to find an antenna that works in any location you place it
:+> : in. There's too many locations a good antenna can't provide a low SWR
:+> : at, no matter how much time and effort you place in tuning the
:+> : radiator first. There are vehicles and customers that can't, or will
:+> : not, compensate the antennas requirements just to have a low SWR for a
:+> : radio to be used with the antenna at a particular location - bumper
:+> : and gutter mounts are one of many locations and mounts, that any
:+> : antenna will have problems working properly. Be-it counterpoise, or
:+> : long-term performance.
:+>
:+> I assume you mean by "not working properly" to mean that the customer
:+> can measure a non-perfect match, then I agree. If you mean that the
:+> antenna is not working properly because the SWR is 1:6.1 instead of
:+> 1:1, then I disagree.

This scenario is where the customer differentiates the issue of knowing versus not-knowing. Nothing is wrong in the above, but a customer "full-bore set" in their ways to see only a 1:1 SWR is what we run into - not all the time, but they're out there.

:+>
:+> ... deleted ...
:+>
:+> : To remain focused on only the antenna, you are not seeing how the
:+> : ground plane image affects the impedance of the antenna. Ground image
:+> : is directly related to how the antennas' feedpoint impedance will
:+> : appear.
:+>
:+> The ground losses affect the antenna impedance, true. You certainly
:+> want to minimize such loss, as it becomes heat - not radiated signal.
:+>
:+> But why do you want to get a 50 ohm impedance, if the antenna when
:+> it is resonant is (for example) 35 ohms? Do you want to increase the
:+> ground losses to 15 ohms, so you will get a perfect match, or would
:+> you rather have the ground losses at 5 ohms, and see some SWR?
:+>
:+> As a hint, the efficiency of the antenna is the antenna impedance
:+> divided by the total impedance.
:+>
:+> Calculate 35/40 and 35/50 and see.

I know what you're getting at Bill, it's not me here that is
disagreeing with anyone on whether a low SWR and a dummy load of a
performing antenna is better than a good antenna that can perform even
though an SWR of 1:1 is not always attainable or needed.

We do go further in demonstrating F/S readings too, to
help the customer decide the correct location height and type
of antenna that works, when the customer is willing to try
something regarding performance versus just simply having
an antenna so they can use the CB to talk to their
friends.

A Wax pencil and a simple F/S meter can go a long way in
convincing customers that location plays a big role. Swapping
to a different antenna at the location is proof in the
pudding regarding antenna performance. Location to determine
the better spots, and different antenna lengths and types to
show F/S changes make the difference.

If the customer has the time for it, it's well worth the wait
and seeing direct evidence of the changes makes the sale.

See several paragraphs above, the Customer wants results - to tell
them to accept something that they find unacceptable is the issue
regarding coax lengths in the above.

:+>
:+> : If the ground is poor, we are going to see problems.
:+>
:+> Maybe.

Attenuation and poor radiator performance are issues. It's not out of
the question to state that some antennas are not any better than a
dummy load at that same location.

It goes back to the old situation of buying an antenna
that looks "cool" on the car - but has less than stellar
performance. It just looks good. Doesn't perform worth a
carp, but "cruising" to look kewl is what these special
cases want.

...[...]...

:+> : Note: I didn't not say, make the antenna resonate, only
:+> : appear to have a low SWR - so the radio can be used even
:+> : though performance will be poor.
:+>
:+> It can be used even with what a CBe,r or many Hams, would consider
:+> "high SWR" - and possibly better than with the low SWR.
:+>
:+> If the antenna is not resonant, it is NOT performing at its best.
:+>

I'm agreeing with you here. "See fooling SWR" above.

:+> I have never seen a CB antenna where the length of coax mattered. The
:+> coax/antenna work together exactly the same, no matter what you do to
:+> the coax length. The radio only sees the input impedance to the coax,
:+> it does not even know that an antenna is at the other end.
:+>
:+> You may get slightly better coupling from the radio to the coax by
:+> changing the coax length, but that is all.

...[...]...

:+> Coax length will not affect the impedance of the antenna, nor do
:+> anything for a poor ground plane.
:+>
:+> : :+> Claiming that a specific length does help is not only patently false,
:+> : :+> it perpetuates a misunderstanding about RF and solves nothing.
:+>
:+> : No, it can provide a tolerable SWR for a customer that didn't want to
:+> : give the antenna what it needs, or the physical constraints that
:+> : locating the antenna in the ideal spot is not possible. So, therefore
:+> : the customer has to suffer, the fate of not being able to use the
:+> : radio, or have a choice to at least use the radio even though the
:+> : performance is not ideal.
:+>
:+> No, the customer would have to suffer learning that he had believed
:+> a myth all these years. If you have a CB antenna that you cannot tune
:+> to under a 2:1 SWR, no matter where you place it on the vehicle, then
:+> you have a defective antenna.

This is the rub, in some locations you can have an SWR of 2.5 or
above, because the customer wants it there. However, just a few inches

away, the proper location we feel, the SWR is a 1:1.

Does that mean the antenna is defective? No.

The antenna doesn't get what it needs where the customer wants it,
they want it there or "no deal" - I'd love to send them on their way
with that type of an attitude, but we accommodate.

Regards!

I have followed this thread, quite amusingly, and I may have missed it completely, but the gist of the matter appears to be a direct contradiction between some folks that neither side has successfully answered without referring to a book and quoting something, but not directly answering the question. The thread seems at a stand still over semantics, IE, you say tomatoe, I say tomato. FORGET impedance, conjugate impedance, matching situations, damaged or inferior coax, test range results vs. "real life situations" , mounting etc., JUST FOR A SECOND! Changing coax line length can SHOW a lower swr, everyone seems to agree, but it appears that no definitive answer has been confirmed as to what I and many others believe, that changing the length unequivocally and unto itself does not affect swr directly and alone, but the domino effect can be endless. The boots required to navigate this thread must be no lower than hip height.

Sparky is a troll. He is posting total nonsense. He either does not
understand impedance or he intentionally posting inaccurate information
regarding it.

A "common misconception"? I never even saw this idea posted before
so it is not common and it is no misconception.

Two identical cables do indeed split the power but not as Sparky
believes. Half voltage _and_ half current would yield one quarter
power; not half. In reality, each cable would have full voltage and
half the current.

jdaggett is correct.

It's 2:1, plain and simple. Don't redefine it because you have an
SWR meter that doesn't work correctly.

Correct. And what is the impedance of the signal going through just one of the 50 ohm lines? 25 ohms. It still doesn't work because transmission lines do not behave like resistors, just like your watchdog said very early in this thread.

Sparky, FLRC

well, most ISP's have an abuse department. For example, at the ISP i work for, if someone gets spam, viruses, or even if they are being attatcked by someone else on the internet, they can send a message to abuse@ptd.net (ptd.net being the ISP i work for) with as much information about where the abuse is coming from, whats happening, or any other information that you have. Other ISP's "should" have similar services, usually the address would be abuse@(insert that ISP's domain here) like abuse@epix.net or abuse@aol.com. If you cant get through to an abuse address try something like postmaster@whatver.com that should get you to the mail administrator at that ISP and they should be able to get you to the right person.

Good Luck!

You can get a Maco v58 for about the same price as an Antron with the radial kit. The Maco is miles better than the Antron. A little more difficult to assemble and tune but the performance is terrific for that type of antenna. Pretty tough too.

Hello All..... I have an X Force Model X60012 Amplifier for Sale. It is a 2X6, with 2) 2sc2290's for the Driver section, and 6) 2sc2879's for the final section.It also has "#12"s Biasing circuit installed, along with a Single SideBand Delay, Recieve Amplifier, Upgraded Power leads, and an 18' wired Remote Control. I have pictures of the Amplifier (inside and out), on a WebPage. I would be happy to forward the pictues to all that are intrested.. No Resonable offer will be refused.
Thanks in Advance, and have a Wonderful Holiday
Season.
Maniac..

Hi Steve,

Can you share some tips for running an illegal business with us?

I would imagine the first thing you do is deny, deny, deny that what you are doing is illegal. Like these CB amps. You probably want to say something like "they are for export only" or "I have no control what people do with my product once it leaves my shop". (Then maybe you push them to cb shops and dealers all over the USA?)

Anyhow, how does the taxes thing work? I mean, I'm sure you don't want to keep records of what you sold to whom, right? Or does it matter?

Is it like a drug business where you don't even bother with taxes? Or are the illegal sales mixed in with the legal sales?

And what about keeping the FCC off your back? Do you have to pay them off, like the mafia did? Or is it some other kind of political deal?

And what about the recent HR2346 legislation that was passed by President Clinton specifically to give localities power to seize illegal CB amplifiers and enforce CB rule violations concerning illegal power amplifiers?

It seems to destroy the excuse that "CB rules are like jaywalking - nobody pays attention to them". I mean, the fact that the Congress passed this legislation must mean that someone really does care about CB rules.

Or am I all wet?

Wondering,

Aaron H. Voobner

What is this load of crap? Why is it around Christmas anyway? Is it just a "me too" false holiday to make people who reject structured religion feel worthwhile?, not to mention more profits for the retailers? Are there any other groups without their own "special" holiday? Maybe homosexuals should start their own and call it "RumpWrangle", where they light 2 brown candles on a NAMBLA member roster. Jeeeeeez, what other garbage can we dream up?

Scott,

I assure you Aaron Voobner is my real name, just as "Scott Unit 69" is your real name. Just because you didn't find any Voobners in your search doesn't mean they do not exist.

But let's get back to the real issue. I have to assume by your angry tone that you believe I am wrong. If that is the case, you might want to explain your position, and elaborate why you believe XForce CB amps are legal. I will listen.

Getting all huffy and devoting your energy to trying to "track me down" makes it look like you are in a big hurry to squelch people who support

legal activity. And I'm sure you don't intend to do that.

Regards,

Aaron H. Voobner

Kwanzaa: "is a festive, non-religious celebration, founded in 1966 by
Dr. Maulana Karenga, during which African Americans celebrate
and reflect upon their rich heritage. It begins December 26 and
lasts for seven days. Each day focuses on one of seven principles:
unity, self-determination, collective work and responsibility,
cooperative economics, purpose, creativity and faith."

To each their own. Valentines Day, Sweetest Day, Secretary Day,ETC. If you
choose to celebrate then do so it is everyone's right. Is it commercialism
you bet, Christmas would be forgot by many if it wasn't so commercialized.
.

> search doesn't mean they do not exist.

You are a lying troll. Face the facts.

> But let's get back to the real issue. I have to assume by your angry
> tone that you believe I am wrong. If that is the case, you might want
> to explain your position, and elaborate why you believe XForce CB amps
> are legal. I will listen.

I don't use that class of amp, so I don't care about them. I think
they are splatterboxes. Maybe it's just the people that use them
run them too hard to be clean.

> Getting all huffy and devoting your energy to trying to "track me down"
> makes it look like you are in a big hurry to squelch people who support
> legal activity. And I'm sure you don't intend to do that.

You act like I've spent more then 5 minutes on you. That couldn't
be farther from the truth. You aren't even worth 5 minutes.

For all I care, if everyone kept their AM and splatter from the last
five or so channels, that would be fine with me. I rarely use AM.

I guess all you know about CB is channels 6 and 19. You can't factor
in everyone from listening to AM. Oh yeah, and have a nice day!

well don the likely hood of a 13 element yagi on 27 mhz thats beside the point but a power increase of 100 to 300 would be a 4.5 db gain, which is about 1 s unit gain (4-6)db = 1 s unit on the average s meter.

>
> Sparky, FLRC

Sparky, your responses are so nonsensical, I have difficulty responding
to them.

If you get full voltage with half current in two lines, you
have a net full voltage and full current.

Why do you think they call it "characteristic impedance"?
Answer: because it defines the relationship between the voltage
and current within the line. E/I = Z

If you know, the relationship between voltage and current in one
line, then you know the relationship between voltage and current
in two parallel lines.

Two 50 ohm lines used in parallel do indeed behave like a single
25 ohm line.

Give us the theory that shows:
22.36 + j44.72 ohms = 50 ohms impedance
and
22.36 + j44.72 ohms will yield a 1:1 SWR

Give us the theory that makes this the equation for impedance:
Z = (R² + X²)^½

> and I have disclosed my credentials.

You said you went to college. You never said you graduated.
My credentials have you beat by a mile but they don't matter
here.

>I have provided a solid reference

You refuse to quote your references verbatim.

> but CLP disputed his only reference,

It was a reference that gave your formula for impedance above.
I showed how the ARRL Handbook contradicted that definition just
a few paragraphs away in the same book. You couldn't accept or
explain the contradiction. You insist that I am wrong even though
I showed you how you are wrong.

If you understood the theory, you would have recognized the
misprint (or whatever kind of error it is) in the book.

> >I'll get your book. We'll settle this.
>
> On his own volition he made this statement, euphemistically calling
> me a liar.

refuse to quote this source verbatim. What are we to think?

> He hasn't followed through on his stated intent to support
> this accusation, because if he did he would have been forced to admit
> that he is wrong.

Not. I've already shown that your equation above is wrong.
You haven't explained how it possibly could be correct.

I've requested your book. It isn't available in any local
library. It is in one of my company's libraries in Indiana
but the staff there appears to be gone for the holidays. I get
no response.

> It is clear that he would rather ignore the facts,
> discredit the authorities, and subvert all logic in order to claim
> victory, even when there is no competition. That's entertainment.

You have no logic. You are correct that you are no competition.

> Until it happens that you obtain my reference and prove his
> allegation, you don't have much to say about what is relavent in my
> discussion with CLP.
>
> Sparky, FLRC

Why can't you just quote it for us? Why do we have to wait for
me to get the book?

Meanwhile, answer my questions.

OK, smart guy, if I have an antenna impedance of 50 + j57.75 ohms,
what length of 50 ohm coax do I need to bring down this 3:1 SWR?

Well, if I add 1/8 wavelength of 50 ohm coax, the impedance becomes
47.8 + j14.6 ohms. This has the reactive component that you claim
is necessary and sufficient. So, what length of 50 ohm coax do I need
to match this now?

3918. Last day for BC-760/ 200xlt Scanners on E Bay

I am not convinced that currents on the outside of the coax cause an
incorrect reading. Those same currents probably also flow on the
outside of the SWR meter where they do not lend themselves to an
incorrect reading.

However, I agree that these outside currents can affect the reading.
Anything that affects these currents also affects the impedance seen
at the antenna. The position of the cable, the proximity of the cable
to other items, how the radio is attached to ground (if it is attached
to ground).

In other words, in the presence of the outside currents (common mode
currents), changing just about anything will change the impedance -- its
like changing the antenna. Just because the reading has changed in no
way indicates that this new reading is inaccurate. You've changed the
antenna; you've got to expect that the SWR will change.

Now let me get this straight. You are objecting to a holiday observance having just finished one that was lifted bodily by the early church from several non-Christian sources, could not possibly have occurred in December, cannot be nailed within 15 years by any existing source, would not have been accomplished in the traditional manner by any competent occupying power, and has been celebrated over the years by looting and general mayhem so bad that celebrating Christmas was not fully legal in the US until about 1840.

Deck us all with Boston Charlie, Walla Walla Wash and Kalamazoo.
God Rest ye Merry Merchants, may ye make the Yuletide Pay.
Angels we have heard on High, telling us to go out and Buy.

With due apologies to Pogo and Tom Lehrer, take a pill, get some sun, and contemplate the lack of testicles among those posting under the Velvet Codpiece or somesuch alias.

Look for built-in drains in the cab, under or behind the seats, and inside the bed walls. These usually look like black rubber rings and are there to allow water to run out of the vehicle yet prevent water from getting in. In a car they are found in the wells behind the rear wheels. In trucks they vary but are usually inside the double-walls of the bed to allow water coming in to drain. If you can't see or get to them inside the walls you should be able to see them from underneath the truck.

You can run your wires through the drain-plugs, but be sure to use a little sense about how yours in particular seal up yet still allow draining. You absolutely don't want to plug them up with silicone seal or similar since doing so will let water collect and rust you from the inside out. However you go through them they must be allowed to drain. If water gets IN through them it can still drain out, so make that the important direction for it to still save your truck. You can, of course, spray some silicone LUBRICANT around the inside to keep the inside from getting wet in the first place and allowing the water to slide back out easier if it does get in.

If you don't find drain-plugs in the cab run the wires through the rubber boot around where the steering wheel goes through the firewall, then down and back underneath. You SHOULD seal these holes with silicone seal if the rubber boot doesn't close up on the wires really well.

Yea, I am still looking as far as employment goes. Kinda hard time right now right around the holidays. I have had a few personal matters here in the last two weeks that I have had to deal with as well, but I should be getting on track here shortly.
I really think that me getting fired at CB City was bound to happen soon anyway after further investigation. Seems as though he has put his wife on full time and created a Mom & Pop business and are able to pocket the money they were paying me. I kinda like the part on their new website where it says to email them about their service department. HA! They have no service deaprtment. The only other person there is a 23 year old kid that didn't ever see the inside of a radio 6 months ago, and only knows what I have taught him and that wasn't much. Peak & Tunes and maybe a protection diode or a final is about all he may know how to do and besides that, his soldering is atrocious.

Take care my friend and have a great Holiday

It does a little over 100 watts and most of that is swing. Works very well. I would let the setup go for $300 plus shipping, but I could not let it go any cheaper. I would be taking a loss at $300 anyway. You cant hardly buy just the radio out of the box for that price, let alone the twister and the mic that is attatched.

Is that a question or a statement?

It could be a question without the question mark.
If it's a question, the answer is no.

It could be a badly worded statement.
If it's a statement, my answer is no.

That's my final answer.

Given a signal of 50V and 1A. Launch it down two parallel 50 ohm
lines. Each line will see 50V and 0.5A. It doesn't work. How simple of
an explanation do you need?

>Why do you think they call it "characteristic impedance"?
>Answer: because it defines the relationship between the voltage
>and current within the line. E/I = Z

One line. But you have two lines now. One does not equal two, no
matter how hard you might try.

>Z = (R² + X²)^²

Like I said before, ask you buddy Doc to explain it to you. At the
same time, ask him how 50 ohms, by definition, is resonant.

>> and I have disclosed my credentials.
>
>You said you went to college. You never said you graduated.
>My credentials have you beat by a mile but they don't matter
>here.

I agree that they don't matter.

>>I have provided a solid reference
>
>You refuse to quote your references verbatim.

And I explained why early in the thread, but I will again below.

>> but CLP disputed his only reference,
>
>It was a reference that gave your formula for impedance above.
>I showed how the ARRL Handbook contradicted that definition just
>a few paragraphs away in the same book. You couldn't accept or
>explain the contradiction.

And you couldn't accept or explain the contradiction in your own
reference, except that it _might_ be a misprint. If you have a problem
with the reference, take it up with the author, just like you said you
would do with my reference.

>If you understood the theory, you would have recognized the
>misprint (or whatever kind of error it is) in the book.

>> He hasn't followed through on his stated intent to support
>> this accusation, because if he did he would have been forced to admit
>> that he is wrong.
>

>Not. I've already shown that your equation above is wrong.
>You haven't explained how it possibly could be correct.

Your accusation came long before I posted the equation you speak of.
You are, as Doc says, obfuscating.

>I've requested your book. It isn't available in any local
>library. It is in one of my company's libraries in Indiana
>but the staff there appears to be gone for the holidays. I get
>no response.

No response from your own company? Ok, then tell me what references
you _do_ have, besides the one you already mentioned but disagree
with, and I will see what is available here. Hell, I might even order
one or two of them. Otherwise, I will be happy to wait until the book
arrives from Indiana.

>> It is clear that he would rather ignore the facts,
>> discredit the authorities, and subvert all logic in order to claim

>
>HA! You are a hoot. You have no facts. You are no authority.
>You have no logic. You are correct that you are no competition.

Classic example of either equivocation or selective interpretation,
depending upon intent. And everything you have said in this thread,
especially this, has been nothing but argumentum ad verecundiam.

>> Until it happens that you obtain my reference and prove his
>> allegation, you don't have much to say about what is relavent in my
>> discussion with CLP.
>>
>> Sparky, FLRC
>
>Why can't you just quote it for us? Why do we have to wait for
>me to get the book?

As I explained long ago, and again is this last post, 'verbatim'
doesn't seem to work for you. Find yourself a book that you are happy
with and that is available here, and then I'll start quoting verbatim
from your selected reference. That way you will have no possible
reason to accuse me of 'misquoting' your own reference.

No, dumb-ass holidays invented to further divide the races is one of the multitude of reasons for racism. To invent a holiday just for African Americans was not very wise to begin with. I would like to know, what is the problem with Christmas? Why couldn't everyone just celebrate that? Why does a particular race have to come up with a separate and distinct holiday not based in any religion? Makes no sense to me. Don't start preaching to me that it is a harmless holiday, it cheapens Christmas and Hanukkah.

Just because you pepper outright lies with a couple facts does not make the whole thing true. Where do you get your disinformation? Christmas has been around for hundreds of years. I know the revised history books feel the need to cheapen Christmas so it makes Kwanzaa appear somewhat equal and it was shoehorned in at Christmas time. If Kwanzaa is not a religious holiday, why it it timed so suspiciously? Why not March or November? It is a second rate holiday no matter how you want to argue it. Christmas and Hanukkah should have been left alone, and Kwanzaa fit in somewhere else on the calendar since it is a non-religious holiday that anyone can celebrate anyway.

It was thought up by a wacko black racist and purposely put the day after Christmas to try and detract from this Christian holiday.

It just goes to show how far the American society has fallen that it accepts and promotes a fake holiday thought up by a black racist.

Message-ID: <20001227095001.21588.00003284@nso-fm.aol.com>
Source record: 65343

Getting married is very much like going to a restaurant with friends. You order what you want, then when you see what the other person has, you wish you had ordered that!

At the cocktail party, one woman said to the other, "Aren't you wearing your wedding ring on the wrong finger?" The other replied, "Yes, I am...I married the wrong man!"

After a qurrel, a husband said to his wife, "You know, I was a fool when I married you." She replied, Yes I know dear, but I was in love and didn't notice.!"

A lady put an ad in the classifieds: "Husband Wanted" Next day she received a hundred replies...They all said, " You can Have Mine!"

When a woman steals your husband, there is no better revenge than to let her keep him.

Eighty per cent of all married men cheat in America the other 20 percent cheat in Europe.

Man is incomplete until he is married. Then he is finished.

COLD as ICE and TWICE as NICE.. Mr. ICECOLD BIG APPLE TREES says.. It don't mean a THING if you ain't got that SWING!!!!!!!

3960. MARRIAGE THOUGHTS (The Man's Version)

Newsgroup: rec.radio.cb
Date: 2000-12-27 14:50:01 UTC
From: icecoldnyc@aol.comICECOLD
Message-ID: <20001227095001.21588.00003283@nso-fm.aol.com>
Source record: 65344

Getting married is very much like going to a restaurant with friends. You order what you want, then when you see what the other person has, you wish you had ordered that!

* This one is especially true when the other "dish" is a hot and creamy looking Italian dish and you got stuck with a "flabby" butt steak.

At the cocktail party, one woman said to the other, "Aren't you wearing your wedding ring on the wrong finger?" The other replied, "Yes, I am...I married the wrong man!"

* This is why some men have taken to wearing their wedding ring on their middle finger. When their wife asks to see if they are wearing their wedding ring, they can show them exactly what they think.

After a quarrel, a husband said to his wife, "You know, I was a fool when I married you." She replied, Yes I know dear, but I was in love and didn't notice.!"

* While this one might be true, at least the men don't change ONCE they are married or in a relationship. They are goofs to start off and that remains the same. What defense do the "nice, sweet and loving" girls that we started dating have to say in their defense ???

A lady put an ad in the classifieds: "Husband Wanted" Next day she received a hundred replies...They all said, " You can Have Mine!"

* Women say things like that, but let them find out that your even LOOKING at another woman and you'll NEVER hear the end of it.

When a woman steals your husband, there is no better revenge than to let her keep him.

* A woman wouldn't need to "steal" a man if the one that he had at home kept him "interested". After all, we know that most guys are lazy. Why would we want to start all over at the beginning with someone new when we've already got what we originally wanted at home ???

Eighty per cent of all married men cheat in America the other 20 percent cheat in Europe.

* MOST men cheat with women. Maybe the woman at home just doesn't realize what she has while the "other woman" does. This brings to mind the old saying "You don't know what you've got until you lose it"......

Man is incomplete until he is married. Then he is finished.

* Nuff said. What more could i add to that ???

COLD as ICE and TWICE as NICE.. Mr. ICECOLD BIG APPLE TREES says.. It don't mean a THING if you ain't got that SWING!!!!!!!

With a name like MANGANO... Who is the us???
Are you Italian??? If so most whites dont accept you as US.
Why???
Because most Italians and Spaniards have African blood in them. Why?
Because the Moors invaded all those countries and stayed in the countries for hundres of years. Hence the reason why some Italians, Jews, Spaniards and others every once in a while come up with that CURLY HAIR!!
So mangano you had better check yourself before you reck yourself, because people like dave & debbie will never accept you as one of them.
There is no US mangano!!!!!!!!

> ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Hi Steve,

Can you share some tips for running an illegal business with us?

I would imagine the first thing you do is deny, deny, deny that what you are doing is illegal. Like these CB amps. You probably want to say something like "they are for export only" or "I have no control what people do with my product once it leaves my shop". (Then maybe you push them to cb shops and dealers all over the USA?)

Anyhow, how does the taxes thing work? I mean, I'm sure you don't want to keep records of what you sold to whom, right? Or does it matter?

Is it like a drug business where you don't even bother with taxes? Or are the illegal sales mixed in with the legal sales?

And what about keeping the FCC off your back? Do you have to pay them off, like the mafia did? Or is it some other kind of political deal?

And what about the recent HR2346 legislation that was passed by President Clinton specifically to give localities power to seize illegal CB amplifiers and enforce CB rule violations concerning illegal power amplifiers?

It seems to destroy the excuse that "CB rules are like jaywalking - nobody pays attention to them". I mean, the fact that the Congress passed this legislation must mean that someone really does care about CB

rules.

Or am I all wet?

Wondering,

Aaron H. Voobner

But these are your claims. Why can't you back up your claims?
Do you have difficulty backing up these claims.

Then why are you making it an issue? Why are you bringing up
credentials if they don't matter?

By the way, you still haven't said if you graduated from college.

Not so. I explained the contradiction. The one formula -- THE
FORMULA THAT YOU RELY ON -- is incorrect. Either the author is
incorrect or it is a typographical error. You have not given any
explanation how your equation can be correct despite your claims
of knowing the theory.

If a book says two different things, how can they both be correct?

> >If you understood the theory, you would have recognized the

Not true. I am merely pointing out the errors in your statements --
errors you've made to arrive at incorrect conclusions.

By the way, speaking of obfuscating, you still aren't answering
my questions, are you? You are dancing harder than a politician to
avoid answering the question.

I get no response from the librarians in Indiana.

I've got plenty of references. I already quoted the ARRL Handbook
section which contradicts your equation but you can't seem to find
any explanation for the contradiction.

Furthermore, I quoted it in entirety with no paraphrasing or
"summarizing" -- something you refuse to do with your reference.

> >> It is clear that he would rather ignore the facts,

I've quoted a reference and you can't dispute it. Is "magnitude of
the impedance" the same as "impedance" or is it not? Your equation
is for the magnitude of the impedance but you used it as impedance.
You don't know the difference.

> > an explanation do you need?

You obviously don't understand characteristic impedance.
Your explanation doesn't work. You cannot launch 50 ohms at 0.5 amps
down a 50 ohm line. If you could launch 50 volts at 0.5 amps down a
line, it would have to be a 100 ohm line.

This is why you get reflections at the interface to a different
impedance transmission line -- you cannot stuff any voltage and
current down the line. The line will accept what it can and the
rest is reflected. What it can accept is determined by its
characteristic impedance.

Let me give you an example that DOES work:

Let's compare one 25 ohm line to two 50 ohm lines in parallel.

You could launch 50 volts at 2 amps down one 25 ohm line.
You could launch 50 volts at 1 amp down one 50 ohm line.
With two 50 ohm lines, you get a net of 50 volts at 2 amps --
THE SAME AS A SINGLE 25 OHM LINE!

> >Why do you think they call it "characteristic impedance"?
> >Answer: because it defines the relationship between the voltage

I know someone WHO WOULD JUST LOVE some RAM, and I think they have a few 2950's in stock. She (Tom's Wife) needs (at least 1) 128MB DIMM for her HP Pavilion. Last time I was over there Tom had at least 2 of them on the shelves. So send an e-mail and ask them... She'd also be interested in the CD Burner, but since you didn't include a model I can't tell if it would work with her machine. (IDE vs SCSI, etc...)

Here's the site where you can find out information on it. With the holidays I don't think Lynn (Tom's wife) has had much time to do inventory, so you'll have to ask them what they have in stock, and how much..

I think everyone agrees, except those without true meaning in their life, that Kwanzaa is a second rate celebration that has no real rooted meaning. It is just a self-serving "celebration" with objects stolen from the genuine religions. But hey, if worshiping idols and yourselves makes you feel like a better person, then go for it.

And you seem to have a problem with the fact that it is a holiday dedicated to one race. You are showing your racist attitude. The way I see it is this. For all the bullshit the black race had to put up with during slavery that is the least you could do is give them a little freedom of choice. I happen to be a white man but I don't want my kids being raised believing that one should judge someone because of their racial, creed or religious difference. Maybe I can make a small dent in the problem. When I hear people calling black people lazy I always think about how years ago the whit man was so lazy they had a whole other race doing all the work for them. And doing it with no pay. I am glad I was not a part of that shit. I never hear a white man bitch about an Indian holiday or help the American Indian receives from the government. Explain that one.

Why should a race of people have a holiday?

> You are showing your racist attitude.

Kwanzaa is a racist celebration, I am merely exposing it for what it is.

> The way I see it is this.
> For all the bullshit the black race had to put up with during slavery that
> is the least you could do is give them a little freedom of choice.

I agree that slaves were mistreated to a great degree, probably more than you and I will ever know and am not happy about that fact. However I do not think that two or three generations down the line, a person who had nothing to do with any of it should give another person all kinds of privileges and reparations that THAT SPECIFIC PERSON is not entitled to. If your grandfather stole a car when he was 16, should you right now pay a different car dealer what a new car sells for?

> I happen
> to be a white man but I don't want my kids being raised believing that one
> should judge someone because of their racial, creed or religious difference.

Kwanzaa is void of religion, there is none - and it is specifically timed to detract from Christmas

>
> Maybe I can make a small dent in the problem. When I hear people calling
> black people lazy I always think about how years ago the whit man was so
> lazy they had a whole other race doing all the work for them.

Like I said, slavery was unfortunate. There were few white men who owned slaves, you make it sound like every white family had a dozen or so to do all their work. Many white people did their own work by themselves.

> And doing it
> with no pay. I am glad I was not a part of that shit. I never hear a white
> man bitch about an Indian holiday or help the American Indian receives from
> the government. Explain that one.
>

American Indians practice their own beliefs and do not force the timing into other religious holidays so as to have the effect of interfering with them. Same with the Chinese, they celebrate their own according to their own time and so on

and so on....

There is a Miss Black America beauty contest that is open only to blacks, just try having a Miss White America beauty contest and exclude blacks and listen to the calls of racism from the Jessie Jacksons. It is OK for them to have their exclusive black whatervers and that is not racism, but the other way around it is I guess. Seems like a double standard to me. The blacks play the race card any time they can.

What's so sad and sick is a pagan ritual being performed during the Christmas season. That's what is *TRULY* sad and sick! I know people from various religions and backgrounds that are offended by the timing of Kwanzaa. Actually someone (a Hasidic) suggested to me that it should coincide with the cotton harvest :)

>Not true. I am merely pointing out the errors in your statements --
>errors you've made to arrive at incorrect conclusions.

Just as I did a couple weeks ago, providing a reference that you
refused to dispute, and was subsequently called a liar. So let's start
at the top of the list.

>By the way, speaking of obfuscating, you still aren't answering
>my questions, are you?

No, because you haven't provided any reference which disputes my
reference, and have refused to substantiate your accusation. Until you
do, I don't feel any obligation to answer any of your questions.

>I get no response from the librarians in Indiana.
>
>I've got plenty of references. I already quoted the ARRL Handbook
>section which contradicts your equation but you can't seem to find
>any explanation for the contradiction.

Email me a list. I'll see what I have and what I can get. I'll do the
same. Any problem with that?

>> >> It is clear that he would rather ignore the facts,
>> >> discredit the authorities, and subvert all logic in order to claim
>> >> victory, even when there is no competition. That's entertainment.
>> >
>> >HA! You are a hoot. You have no facts. You are no authority.
>> >You have no logic. You are correct that you are no competition.
>>
>> Classic example of either equivocation or selective interpretation,
>> depending upon intent. And everything you have said in this thread,
>> especially this, has been nothing but argumentum ad verecundiam.
>
>Hee hee! Now your going to lay a little Latin on me because you can't
>lay a little RF theory on me?

Do you want it translated? Because you just did it again.

>I've quoted a reference and you can't dispute it.

After I quoted a reference you coudn't dispute. First things first.

>By the way, you still haven't said if you graduated from college.

You said that credentials don't matter, and I agreed. What's the
problem? You can't even let _that_ rest? Are you on a superiority trip
or something? You never said why your credentials are so impeccable.
So tell everybody all about your credentials and get it out of your
system. And don't forget to disclose your true identity so that they
can be verified.

Dont be an asshole hatemonger!
Why could he have no problem with one and have a problem with another.
That's like me saying that I like blacks, but I hate jews.
I like chinese, but I hate the japanese.
I like white guys with brown eyes, but I hate those with blue eyes!
Come on get real. It's just a friggin holiday!!!
Guess what??? You dont have to celebrate it if it offends you. Just like people
who dont want to celebrate other holidays dont have to!
Again I say to the sane folks...
WHAT THE HELL DOES THIS HAVE TO DO WITH CB???
Nuff Said!

Seems to be a rush to judgment and right away labeling me a hate monger. I don't have a problem with black people but you insist that others view me that way, why? Are you really the racist hate monger?
I still have not had a reasonable answer as to why Kwanzaa was piggybacked onto Hanukkah and Christmas.

There's that hate monger label again, I repeat - I have no problem with the black race but Kwanzaa is a major joke. It's easy to have a problem with one and not the other, I like Ford, Chevy, Nissan, Mitsubishi but Yugo was the dumbest thing going and it was a major stupid product. Now I guess you are going to say I hate Yugoslavians?

Not so, it's like saying all of Europe benefited from Hitler. Some people did and some did not, most did not so you should not hold the innocent as guilty as the offenders just because of their circumstances put them into the same group. Not to mention this whole race thing is generations later. Were you a slave? Was your dad a slave? I think not, so why the hell would I owe you anything I worked for and is rightfully mine? If you find yourself falling behind, get off your ass and work for it the same way I did.

I had previusly posted that this gent had toned down his site, however, I was in error. The voting button has reappeared and an "Unlicensed Radio Operator's" forum has been added. I'm curious, is this gent truly indicative of amateur ops' sentiments toward 11 meter ops? I want to get my Tech"+" and then my General. Should I keep my mouth shut regarding my 11 meter roots? I have to admit, I find it a bit disturbing. I'd like to believe most hams will extend a helping hand.

Curious -

Maybe I can help. I ran into a program called ad-aware. It is freeware (nice!) and I believe I got it off ZD-net. Look up zd-net.com and check out the PC downloads. You can search for ad-aware. I tried it and the darn thing found something like 15 spyware programs in my system and 40 files. It automatically deleted all. This did result in Freelane and Juno no longer working, but I still can get the e-mail off both through the AT&T account. I can also reinstall them if I wish. Everything else works fine - and I'd bet that gets rid of your advertising scripts! Look it up on zd-net and if you can't find it, e-mail me at j.r.hampton@worldnet.att.net and I'll see if I have the installation file somewhere on my hard drive (if not, I'll check the other favorite sites, but I think you'll find it).

By and large, we will -- some, of course, more than others. In general your 11 meter background is a problem only if you make it one by assuming it has any relevance whatsoever. Might I suggest you add element 3, the General, to your studying. It is essentially a rules and regs section in which the FCC takes you thru all of the nice ways you can get into trouble and discharges its legal and international responsibilities. You really can't practice code more than an hour a day, Element 2 is trivial, and Part 97 makes admirable bathroom reading. Pass the General and you are in the fraternity.

If you haven't found it yet go to http://www.ah0a.org. Joe Speroni's Ham Academy and Morse Academy are first-rate. Some good practice is on http://www.qrz.com. I will open my spam filter for you so feel free to ring my chimes if need be.

Thrown off Ebay with day left to go. Total at time of cancellation was $202.00. First offer at $200.00 will get the radio and I will pay the shipping. Radio is a very clean example. 8950 is strong. Tunes up great. Minimal drift. I sold the D-104 I had been using but I will include another
Non-amplified D-104 and plug to wire up. Pictures upon request. Reply to (bk43@pacbell.net). All legitimate inquiries will be considered. Heck, even the
illegitimate ones will be. ;-)
One question: Are STOCK 1011D's considered an illegal radio or, has eBay
just gone completely off the deep end?

sir, sir , please, please . you know i will go with the idea that you
think that most hams used to be cbers, but aren't you stretching it a

bit to say, that most hams talk on cb radios? if indeed this is the case, and i submit to you, that is not the case whatsoever. after 20 some odd years of talking on cb radios, i could count on one hand the number of hams who talked with regularity on cb radios in my area. and my area shall we say was a hotbed of cb radio activity up until about 1993 or so, then it started tailing off. but my point is this. why should they talk on a cb radio??? all the skip, noise, etc, etc. geez, if i could go somewhere quiet and carry on a decent conversation and all i had to do was say my call , every ten minutes, then why in the sam hill would i return to my, as you say, roots. no sir, hams don't talk on cb radios and if they do, then they obviously like it better than the ham bands, which is a point that has been broached out here before. which i think is something to be said about anyone thinking that for one minute, by getting uncle to say you are cool because you have a license, that everything will be better. sir, may i remind you , that there are places on the ham bands that make cb look like child's play, with the threats and the cussing and whatnot. no cb is its own world, and when you guys come down to play, then you must love it and you must love it all and not try and change it and make it something it is not. a controlled atmosphere, where all the creative roots are squelched. in cb the end does jusify the means, and if you can do it, then you can do it and you don't need anyone looking over your shoulder to tell you how to do it because you already know how, even without a danm elmer. you guys constantly come on here, complaining about the usage of amps, yet, you want to talk on your cb radios. this while you guys also use what may be construed by any level headed observer, illegal amps utilizing, to wit, 3000a7 tubes and triple 500z boxes. of course i know, that is so you can bust through the qrm pileups, i believe , you guys call it. yeh , we all know about those damn qrm pileups don't we??? and of course you bleed all over your neighbor's stuff, but that is ok isn't it? because you have a piece of paper that says its alright for you to do so, so you do it. now isn't that special. so i think it is imperative to understand that this cb radio as you call it, is a living breathing hobby, and it undergoes changes and since God knows how long, it has not been the habitat of qrp radios, but of radio outlaws, freebanders and assorted good buddies on channel 19 and other mudducks. so tell me its not so bob. do ham extra class operators , you know, the ones that have been at it for a while? do they really talk on cb radios??? i think not,.....cd is out....

If it's as you say then you can get a pretty good chunk 'o change for that radio. I've seen good to very good examples go for 300 to 400 bucks. If your 's is really brand new, who knows? I'd venture to say around 500?
Good luck.

:forum has been added. I'm curious, is this gent truly indicative of amateur
:ops' sentiments toward 11 meter ops? I want to get my Tech"+" and then my
:General. Should I keep my mouth shut regarding my 11 meter roots? I have to
:admit, I find it a bit disturbing. I'd like to believe most hams will extend a
:helping hand.

Most will be more than willing to help - even if you are not a Ham, as long
as what you want to do is legal.

No, he is not typical - although there are far more like him than there
should be.

My impression is that this ham appears to be concerned about illegal incursions onto the 10 meter band. I don't think he just hates CBers for the sake of hating CBers - as some of you erroneously suggest.

SSB411, this guy is no way indicative of most hammies, although he certainly may have a following among a few of the "gray matter deficiency" afficionados. More than likely a cber ticked him off in one way or another (keyed on him for preaching, stole his wife, slept with his daughters, beat up his son, etc.) and this is actually a sad attempt at getting even. See, folks like this who lash out at a specific target without a real, intended and stated legitimate purpose are usually self-projecting, are slightly aware of it, and somehow receive an inner ego boost by attacking those who they are in envy of the most and are closet admirers of said subject. Happens consistently in here, just look around, we have a few insecure loco's in here, but we got 'em on a string, right where we want them. Don't let hate mongrels dissuade your decision to become a hammie. Do what you want because YOU want to do it, and the rest be damned.

Yea, what he said! You don't like it, don't celebrate it. We have an "Arbor Day" each year, do you run out and plant friggin' trees? If it don't apply, throw it out the window. A radio transmit holiday, once a year, a 24 hour amnesty session that includes a suspension of rules, now that's a holiday.

well james, that is a good program. i downloaded it and it took off
about 10 spy programs that i wasn't aware of. cool. however it didn't
get that damn brouser enhancement thing. it is called gohip and as soon
as i figure out how these things work, i will get it reoved. i
recommend steve gibson over at gibson research, grc.com,. he is hot on
the trail about this intrusive spyware stuff. i am all for individual
rights and privacy. i think it is disgusting for these companies to
follow you around on the net, taking notes on what you do and where you
go,.........cd is out.........

Hello Aron: No people are paying attention to this. If the radio had
two 8950's finials instead of one, it would go for a higher price.
Everybody knows that.

Glad to help out here.

Jay in the Mojave

The Amplifier has a "Silver" exterior case. it has a copper (gold color) board. These pictures were taken with a $500 Minolta digital camera, I think they came out great. and for Steve fom Exports r Us, he thinks that the box is a Dave too. he can think what he wants. It IS an X Force unit, that was put together RIGHT. And it DID NOT come from Exports R Us...

For reference purposes only: Dave Made boxes DO NOT have the biasing circuit that is in this particular Amplifier. This was designed by Dennis "#12" Chicago.(as the X600"12", in the model # signifies.) it pulls a little more current, but it works very well with the SSB delay.

I would check your input combiner(3 port) on the front of the case the bottom coax is not soldered to the board or anything. yes your camera is good I was able to see that mistake And it is a xforce chassis not a davemade. I would like to see you take a pic of the side of the amp which will give a side view of the bias circuit

I see some of you have a problem if ANYBODY (especially a ham)
disapproves of illegal operation. You feel you have the right to muzzle
anybody that doesn't jump on your criminal bandwagon. I have seen hams
come into this newsgroup, hat in hand, apologetic and afraid to hurt the
feelings of illegal outbanders. Hogwash. The only "admirers"of illegal
activity are other illegal losers.

Well, Joe! That is very interesting indeed. Thank you for the info.
After I get done writing to ebay about their totalitarian tactics and
let them know there is nothing wrong with listing an amp under
"electronics" or "amateur" listings, I may even add a sig to my email
blasting ebay for their "utilization and abuse of customer information."
I already forwarded a copy to the ACLU, not that it matters, and may
even construct a paranoid web page dedicated to slamming ebay and their
joining with law enforcement. We already have Dare kops in grade schools
with black, padlocked boxes, which our heroic gimps in blue telling our
kids, "If you know anyone who does drugs, write their name and address
or phone number on a piece of paper and drop it in the box."
It's a miserable day when the country turns it's citizens against each
other. Sort of like you said, certain hammies who get their jollies
keeping a kill file of what they can knock off ebay. As the saying goes,
"I didn't speak when they came to get my neighbor because it didn't
involve me. I didn't speak up when they got my other neighbor because it
also didn't involve me. Now they came for me, and there is no one left
to speak up". It's not paranoia when they really are out to get you!

Perfect example of the damage this NG does by fostering a climate where people are genuinely confused about what's legal and what's not. I don't know what a Siltronix RF output is but I imagine it is more than 4 watts. It also probably has a VFO. And it's probably not type accepted for CB use.

Of course all this appears to mean nothing to the majority of this newsgroup.

>
> Sparky, FLRC

This example applied directly to the question at hand and your
statements of non-facts.

You could use a quarter wavelength of 25 ohm coax to match a 12.50 ohm
load to your 50 ohm radio.

Despite being able to give a possible way to use 25 ohm coax with a
CB, I agree that we should not diverge too far from the core reason
for the newsgroup.

My reason for being here is to dispel myths and correct inaccuracies.
Your statements were inaccurate. By the way, you do agree with my
example, don't you? You seem, once again, to be getting away
from the substance of the discussion.

So, for you, Sparky, I will change my example.
Let's compare one 50 ohm line to two 100 ohm lines in parallel.

You could launch 50 volts at 1 amp down one 50 ohm line.
You could launch 50 volts at 0.25 amp down one 100 ohm line.

With two 100 ohm lines, you get a net of 50 volts at 1 amp --
THE SAME AS A SINGLE 50 OHM LINE!

Sure looks that way, if you set your member preferances not to have them
Spam you with offers and crap you would not have be notified of what they
did.

Check this out:
You sign up and are automatically given hidden default preferences
Yet you can not set your personal preferences till after you give them your
life info and create the account
, then a screen pops up saying it will take up to 30 day to come into
effect.
If you are a seller "your pants are down to the world"
So you change you settings
But yet you agreed to all the disclaimer's and future changes in your
original agreement so privacy means about nothing !
Big Brother's, the IRS, FCC, TRW system's, and must be building file's on
everybody yet sitting like a pack of wolves.
Why ?:
Note the section "Revenue Enhancement" in the recently passed bill.

What with all those trunking scanners that people are spending good
money on and all those trunking programs that let your computer controll
non-trunkable and trunkable radios and the fact that radios can be
programmed over the air; leads me to some interestingf questions:
1.) Can a computerized virus be sent over the air?
2.) Can a scanner be infected with one or more of these BUGS?
3.) Can a cellphone be infected?
4.) Is there an anti-virus program that can get rid of a
bug like that?
5.) Can those PALM type computers be infected too?

Well, Joe! That is very interesting indeed. Thank you for the info.
After I get done writing to ebay about their totalitarian tactics and
let them know there is nothing wrong with listing an amp under
"electronics" or "amateur" listings, I may even add a sig to my email
blasting ebay for their "utilization and abuse of customer information."
I already forwarded a copy to the ACLU, not that it matters, and may
even construct a paranoid web page dedicated to slamming ebay and their
joining with law enforcement. We already have Dare kops in grade schools
with black, padlocked boxes, which our heroic gimps in blue telling our
kids, "If you know anyone who does drugs, write their name and address
or phone number on a piece of paper and drop it in the box."
It's a miserable day when the country turns it's citizens against each
other. Sort of like you said, certain hammies who get their jollies
keeping a kill file of what they can knock off ebay. As the saying goes,
"I didn't speak when they came to get my neighbor because it didn't
involve me. I didn't speak up when they got my other neighbor because it
also didn't involve me. Now they came for me, and there is no one left
to speak up". It's not paranoia when they really are out to get you!

Twisty et al,

If you do not like the laws, you are free to change them. I want to go on record as saying that I think your heroic "civil disobedience" is merely an excuse to be a criminal. If you TRULY disagree with the FCC (and Ebay's) policies, you will DO something rather than hiding under a rock while you sneak around breaking the law.

If you believe that CB should be an anonymous lawless alternative to ham radio (unlimited power, no frequency restrictions, no accountability, etc) then, for God's sake, stand up for what you believe in. Organize. Write your congressman. Lobby. Make phone calls. Write to magazines like POPCOMM. If yours is such a sensible idea then surely many others will believe in it, too. Go out and do the work to make the change.

Otherwise, you're merely a common criminal and your arguments are just excuses why you should be allowed to be a criminal and get away with it. You're like someone who goes to the grocery store, walks out without paying, then when arrested, complains and whines that their "rights" are being trampled.

You are an authority on religious holidays? Where did you study? Don't dabble or try to defend things you obviously know nothing about. And while you are at it, you should throw out those revisionist history books. Although you speak from a politically "don't think for yourself" correct point of view, it is apparent you have been misled very craftfully to believe that any largely organized group is a sect.

*Greetings!
*
*You mean to tell me then, that 25 ohms load is 2:1 SWR?
*
*Is that correct?
****
Yes:

RC = (ZO - ZL)/(ZL + ZO)

where RC is the reflection coefficient
ZL is the load impedance
ZO is the characteristic impedance of the transmission line

In the example ZO = 50 ZL = 25
Therefore we obtain

RC = (50 - 25)/(50 + 25)
RC = 25/75
RC = .33333

Since the there is no imaginary part of the reflection coefficient the magnitude
will equal the real part. ie .33333

Now we calculate SWR

S = (1 + |RC|)/(1-|RC|)

Where S is the SWR reading and |RC| is the magnitude of the reflection
coefficient. Now from our example we obtain:

S = (1 + .33333) / (1 - .33333)
S = 1.33333/0.666667
S = 1.999985

or close enough to call it 2

No, you're probably right, my opinion means squat to the jagoffs at Ebay. But enough folks write and tell them why they will never, ever utilize their service again, and state exactly why, well, a snowball effect would be desirable. Look how quick an internet rumor spreads across the web. I can write as good as propaganda espousing the con side of their stance as well as they can with the pro, better in fact. Boycotts have been effective in the past towards all kinds of businesses. Maybe some of their competition auction sites can even put that in their PR, such as, "We don't give your information to ANYONE, unlike Ebay, who through cooperative efforts with law enforcement, compile your personal data and share it with whoever they deem fit". This is pure BS, and I'm not referring to just radios on Ebay. Abuse of this system is already in place just waiting to taken advantage of, in fact, it probably already occured.

You would have to at least double the output to get a "hint" of increased range, & I doubt the little frs radio with 3 "Double A" batteries is even capable of anywhere near double the output.....

I would just get an HT and modify it for out of band if I wanted greater
range on FRS or MURS. The HT has an external antenna connector.

I just posted that to make Aaron's blood pressure boil!

F*ck the troll. Now ignore him. Let him scream into his little
RS radio and RS mag mount on CH 6 all day long!

Good info at this link:

http://enterprisesecurity.symantec.com/article.cfm?articleid=416

A trojan horse (not a virus) is more likely but most items you
listed aren't programmed via RF transmission so they are immune.
If my Palm Pilot gets a bug, I do a manual reset, then a hotsync, which
recovers
all data (including programs) since the last hotsysnc. No big
deal to recover, which takes the "fun" out of it for bug programmers.

Law? Ebay makes laws? Where the hell do you get the stuff you spew? Where
does this stupidity come from? Is it genetic? Are your parents as goddamned
clueless as you? Little robot, Aaron Voobner.

I want to go
> on record as saying that I think your heroic "civil disobedience" is
> merely an excuse to be a criminal.

It's his right to expose Ebay's storm trooper tactics. They do not have legality to back them up. They have falsity, innuendo and arbitrariness. Since they hold all the cards, they'll get away with it. Doesn't make them right.

If you TRULY disagree with the FCC
> (and Ebay's) policies, you will DO something rather than hiding under a
> rock while you sneak around breaking the law.

Voobner! Get a fing clue! There is *NO* law being broken, unless you mean the possibility that Ebay is breaking one when they expose your information, without your consent, when there has been *NO* law broken. You're an fing Nazi wannabe, aren't you. "Bring back the Hitler Youth", says Aaron Voobner.

What organized group do you mean? Catholics? Baptists? Mormons? Jews?
Muslims? Those organized groups? The ones that cannot get along and, though
they all believe the same basic theory, will kill anyone else that think
exactly as they do? Paganism was here long before those desert rats left the
"holy" land and spread their own "version" of the big lie, Bub. Who's being
misled? A sect is a sect. Admit it and move on. Also, may I suggest you stop
wearing your sect's beliefs on your sleeve.

:+> RC = .33333
:+>
:+> Since the there is no imaginary part of the reflection coefficient the magnitude
:+> will equal the real part. ie .33333

The above is what I have to stop and do a "Whoa" on, now since we are
looking at completely resistive loading, I can understand 2:1 SWR
while using a 25 ohm resistor.

It's the part concerning the magnitude and reflection coefficient.

I need to know why it's being discounted here, is it due to no
reactive loads, or simply plain resistance...?

This may be why I don't see a 2:1 swr when dealing with reactive loads
showing 25ohms, with reactive components.

It's hard to get past this point without further clarity, I think we
might be discounting, or disregarding, an important point here.

:+>
:+> Now we calculate SWR
:+>
:+> S = (1 + |RC|)/(1-|RC|)
:+>
:+> Where S is the SWR reading and |RC| is the magnitude of the reflection
:+> coefficient. Now from our example we obtain:
:+>
:+> S = (1 + .33333) / (1 - .33333)
:+> S = 1.33333/0.666667
:+> S = 1.999985
:+>
:+> or close enough to call it 2

External antennas to FRS radios are way easier than attempting a mod.
As Tim alluded to, HF rigs are the way to go for this if you really want
it bad enough.

Sure looks that way, if you set your member preferences not to have them spam you with offers and crap *like most people" you may not have be notified of "things".

Check this out:
You sign up and are automatically given default preferences
Yet you can not set your personal preferences till after you give them your life info and create the account
, then a screen pops up saying it will take up to 30 day's to process your personal preferences to come into
effect.
Till then "your pants are down to the world"
.....So you change you settings
But then you agreed to all the disclaimer's and future changes in your original agreement in the fine print so privacy means about just about nothing !
Big Brother's, the IRS, FCC, TRW, must be building file's on everybody wile sitting like a pack of wolves waiting to feed when they have enough to make up a case with the local "Bubba" sheriff or asshole down the street who does not like you.
Why ?:
Note the sections regarding "Revenue Enhancement" "Local and federal distribution of fine and forfeiture moneys" in the recently passed bill.

I'll assume you meant to say 0.5 amp, not 0.25 amp.

>With two 100 ohm lines, you get a net of 50 volts at 1 amp --
>THE SAME AS A SINGLE 50 OHM LINE!

Works for me.

If a Sil is so easily snuffed out of E-bay then so should any other
amateur radio.

TS-940s, MP1000, IC706mk2G ect ect. They should all be treated
equally. Just contact the below thread and complain that these
radios can easily be modified to operate on the CB band. This is
illegal.

Therefore E-bay is hereby notified that if they let this illegal
auction continue then it would potentially include E-bay as an
active participant in such illegal activity.

:+> : On 25 Dec 2000 09:03:19 GMT, while the modem was ice fishing with the
:+> : Mouse, Bill Nelson <billn@spock.peak.org> dissertation the following:
:+>
:+> : :+> Would you believe anthing that was not quoted from authority? Have you
:+> : :+> tried the various experiments that I have outlined in various posts that
:+> : :+> would allow you to prove or disprove the claims I have made?
:+>
:+> : When I put to the group the conjugate for the 25ohm - j5 - only one
:+> : person made an effort, it was George.
:+>
:+> This has nothing to do with what I asked above.
:+>
:+> The conjugate is trivial to determine on a Smith Chart. Why bother, unless
:+> you need it.

[I really didn't want to say this, but you did ask a second time so I
am forced to say the following]

This is where the word "Authority" tends to fly out the window.
"Unless you need it" is a good phrase to use in this.

The subject of coax length, and the issues of "Some see a change" and
others "Simply does not work" are the crux of this.

I firmly believe in something that does occur, classify me a "Some see
a change" and my stance is due to "Apparent" SWR issues.

I also believe, and state correctly, that "You now have to use this
length of coax all the time" due to the "Apparent" SWR issue.

That is my stand.

Why I stand like this on the issue, is because no one can prove to me
otherwise. Sure some can banter on about credibilities, that's their
business.

To use the word "Authority" is self-defeating, laws of physics apply
here, not laws governed by individuals. A well-learned individual may
know what they're talking about, but resolving a simple issue of coax
length regarding antennas and poor locations should be met with an

open mind. Not dictatorship or Totalitarian doctorates. Someone should have the answer, I believe I've found some agreement on this regarding what you and I have been posting about...

I know, that when an antenna is resonate at the factory, over a given ground plane image, that antenna has special requirements that it has that same ground plane available at the operators own location. Otherwise we have a problem with SWR.

Although SWR is not a big problem regarding adequate ground plane, an SWR mis match of as high as 3:1 can be tolerated for almost infinite amount of time by a CB radio when it's operated with an ideal ground plane. Losses? That's another story. But, at this juncture, not a big deal.

To say Coax length doesn't matter, simply doesn't work that way, we are dealing with some simple physics problems. I know something is happening, but not too many other people are willing to really hash this over without a flame-fest erupting. I'm trying to be rational about this.

Coax length? Shouldn't matter, "Unless you need it".

:+> : BTW - the SWR scale for 25 to 50 ohm mis-match is not 2:1 it's closer
:+> : to 2.7:1 - 33 ohms is closer to 2:1 mis-match - why? Read about SWR
:+> : meter scaling issues regarding Logarithm, Linear and Scalar.
:+>
:+> Meter scaling issues have nothing to do with it. The meter is calibrated
:+> to display the correct SWR.
:+>
:+> SWR can be calculated, regardless of the meter scaling - as long as the
:+> meter displays the correct forward and reflected wattages.

I'm waiting for James to come through with a post or two, he mentioned something I must question, regarding reactive loading. I don't believe that the SWR for a 25ohm load [with reactive components] is 2:1 - I had a good example of that in my own life.

Now, resistive? This is where I grind to a halt, James brought up a statement regarding reflection coefficient. I would think that any antenna designer worth their salts would be seriously interested in that value. If the designer won't discount it, I don't think we should either. This helps "re-create" the problem to understand the answers.

I've got ta' stop here and call it a day.

Bill, you brought up a good point about "Shifting of resonance" - you are providing a good perspective on this. I appreciate that.

Happy New Year!

Regards!

Andy, throw that MFJ 259 in the trash that has to be what you are using, any maroon would know that 25 ohms or 100 ohms are a 2:1 swr,seems you are arguing things and you dont understand even the simplest equation.

Oh my goodness I don't know where to begin.

Regarding the Siltronix discussion. Someone gloated that "unmodified" amateur radios are being booted off of eBay and that amateurs have screwed themselves by going after illegal CB's. How in heavens can you guys be so proud of having messed up eBay with your illegal activity so that as a result now the legal people have to suffer? This makes no sense to me. I have to sit down and take an aspirin because the very thought of it is distressing me to no end.

Then I see discussions about how to mod FRS radios for higher power. I ask you, what good can come of this? Must you cretins make FRS into the cesspool of anarchy that CB is?

And now the "phoneman" admits that he is in the illegal CB amplifier business. And that he and Piland work for NASA is ironic. Let me ask you guys a question. What if some bozos decided to use the Shuttle Com Link frequencies to "freeband" on? Would that trouble you? Probably not, since breaking FCC rules doesn't seem to matter to you at all.

And regarding the eBay controversy. No, I never said there were eBay "laws". You charming fellows in your vast ignorance were unable to comprehend a sentence containing a compound subject (e.g. "FCC and eBay"). I'm going to have toi start adding footnotes here with message numbers like Fuller did. Is that what you want?

And please check the profanity. It only serves to detract from your credibility. Although I don't know anyone who would think ANY of you anonymous heroes were credible individuals whose word should be given any credence whatsoever.

Aaron H. Voobner

I have found the old mods for the Tomahawk for 10 meter - 11 meter but I just bought a new one and the little board where the jumpers were is not there. Can anyone please give me some help on this radio. The old mod was to move te black jumper from pins 1 and 2 over to 2 and 3 and this is not in the new radio.

Thanks,
Dave.

Well what am I supposed to think of that? Is sounding like Mark Fuller supposed to be a really bad thing? As far as I can see, lots of people in this NG started getting very nervous because he was merely bringing up legal issues.

>It is the cb mentality to screw up anything related to radio
>communications.

I don't know if it the CB mentality or just the mentality of the lowlife type of person. I cannot for the life of me get enthused about purposely "keying over" someone else. The idea of "locking up a channel" or "plugging ears" doesn't appeal to me. Intentionally trying to ruin someone else's communication experience seems like a selfish child's game played only by bullies. And running companies that create or sell products that are designed to help people do that sort of thing seems like a very nasty way to make a living.

I am appalled.

Hey, why not write directly to the FCC, since their federal regulations
are the reason for the eBay policy? Try and convince them that CB
linears and export radios need to be marketed freely. Tell them all
about the conspiracy to abuse your rights as an illegal radio
operator. And be sure and use words like "jagoff" in your argument.

>
>What with all those trunking scanners that people are spending good
>money on and all those trunking programs that let your computer controll
>non-trunkable and trunkable radios and the fact that radios can be
>programmed over the air; leads me to some interestingf questions:
>1.) Can a computerized virus be sent over the air?
While it is posible to send anythgin over the air, I would not worry
about my PC/radio becoming infectred by data that I am monitoring.

>2.) Can a scanner be infected with one or more of these BUGS?
Even fancy radios like the PCR1000, that have EERAM, do not accpt a
program that could be infected, but only accept data. Bogus data might require
a hard reset, but that would the worst.

>3.) Can a cellphone be infected?
Not today, but as they make phones smarter, it could happen some day.
>4.) Is there an anti-virus program that can get rid of a
> bug like that?
No bug, no cure..
>5.) Can those PALM type computers be infected too?
This is a funny one, I won a 2 litre Dr. Pepper back in August from a
friend, we had made a bet a year ago that someone would take the time to
create a virus for a Palm computer. I missed the event, but 3 or 4 days before
the bet was to expire Macafee announced a Palm virus and a cure. As the owner
of a brand new plam unit I will have to learn a lot more about their uses and
risks.

: If a Sil is so easily snuffed out of E-bay then so should any other
: amateur radio.

There is one major difference. The Siltronix was designed for use on 11 meters. From past experience, very few were purchased by Hams for use on 10 meters. Why should they, when only 10 meters was available, and the rigs all drift badly.

: TS-940s, MP1000, IC706mk2G ect ect. They should all be treated
: equally. Just contact the below thread and complain that these
: radios can easily be modified to operate on the CB band. This is
: illegal.

Actually, modification so that they can operate on 11 meters, if performed by a Ham - is totally legal. Whether we like it or not, as CBers, that is how the regulations read. That does not mean that it is legal to use them on 11 meters - although there is an exception in a life-or-death emergency.

Not just the newsgroup but the majority of the CB population. Get a life and fight a battle that you can win.

<aaronvoobner@my-deja.com> wrote in message news:92fv7ular1@nnrp1.deja.com...

Perfect example of the damage this NG does by fostering a climate where people are genuinely confused about what's legal and what's not. I don't know what a Siltronix RF output is but I imagine it is more than 4 watts. It also probably has a VFO. And it's probably not type accepted for CB use.

Of course all this appears to mean nothing to the majority of this newsgroup.

<<who cares? and if somebody cares why do they? aaron i'd like you to tell me how you personally have been affected by cb'ers that you feel its your life mission to correct our wrong doings.>>

Oh Tim,

Round and round we go, when will we stop, nobody knows. Is it my life mission to curb CBers, Tim? I hope not. I'm just here to add a little reality to the group discussion.

As far as I can see, you guys in rec.radio.cb have been existing in a fantasy dream world for a long time. In this dream world, high powered linears don't mess up anybody's enjoyment of CB, all frequencies between 25 and 35 MHz are open and up for grabs, and everything illegal is OK, as long as you don't get caught.

Now many of you have awakened momentarily from your self-induced dream world and noticed a couple of recent developments happening out in the real world.

#1. The US Government passed HR2346.
#2. eBay banned CB linears and other illegal CB devices.

Now the average person would see that and conclude that "Gosh, maybe I shouldn't be an illegal CBer". But you, Tim, and many of the others in here are evidently not the average person. Perhaps you think you are special. Or that the laws do not pertain to you. Or that you will only obey the laws that are convenient to obey. Or some such quasi-libertarian hooey.

And technicalities. I have never read so many laughable excuses based on technicalities. "It is OK to have a 10 KW CB linear and a VFO tuned to 32 MHz just so long as you don't use it - wink wink". Etc. And seabag lawyering galore. You guys are like naughty schoolboys who know they are wrong and are trying to weasel out of it any way they can.

Whatever the case, by continuing to deny the fact that you have any accountability for your little radio piracy, you hope to stay blissfully in your little dream world.

Sorry to burst your bubble, guys.

I did no such thing.

A quarter wavelength of 25 ohm transmission line will match 12.5 ohms
to 50 ohms.

There is no length of 50 ohm transmission line that will match
37 ohms to 50 ohms.

Where did YOU see a contradiction?

It didn't have to be completely resistive loading. That's what
was specified.

25 ohms = 25 + j0 ohms

James' calculations were right on the money.

> It's the part concerning the magnitude and reflection coefficient.
>
> I need to know why it's being discounted here, is it due to no
> reactive loads, or simply plain resistance...?

It is not being discounted. Somebody said 25 ohms and that's
what he used for the calculation. What did you expect?

> This may be why I don't see a 2:1 swr when dealing with reactive loads
> showing 25ohms, with reactive components.

If there were a reactive component, then it wouldn't be 25 ohms;
it would be 25 + jX ohms. This, by the way, would create an
SWR greater than 2:1.

> It's hard to get past this point without further clarity, I think we
> might be discounting, or disregarding, an important point here.

Nothing is being discounted or disregarded. For a 25 ohm load
the SWR is 2:1. The calculations are right here on the table.

Well, I guess I know the difference between legal and illegal. So that makes me "an expert in ham stuff" to you. Go figure.

Did I say I was studying for a ham license? OK, I guess I did. Well, I wasn't going to tell you, but since you asked, the truth is that I was studying, but you fellows got me so distracted here in rec.radio.cb that I just put it all aside for now.

See what you've accomplished?

You guys ask me what I want. Well for starters I want Mr. 137 to get a nice, clean FCC type approved 40 channel CB rig with no mods and a decent antenna and I want him to be nice to people on the air. For a change.

Then I want Mr. Tim Kp82 or whatever he calls himself to ditch the phoney callsign, put his illegally-operated ham rig away in the closet and never bootleg again. And get a good haircut while he's at it.

Then I want Jay in the Mojave to post his ham callsign accompanied by a confession about why he is ashamed to be a ham and pretends to be an ignorant redneck type of person who drinks and collects welfare.

Oh yeah, I'd like that Curious Dan guy to take all his illegal crap, generators, blowers, pills, amplifiers, coax, and whatever he's smoking and dump it in a big 55 gallon drum and pour gasoline into it and drop a lit match into it.

And just for good measure I'd like Scott Unit 69 to put all his overpowered illegal radio gear in the trunk of Mobile51's car and drive it straight into the Chesapeake Bay at high tide until it sinks.

Last but not least I'd like to see ExportsRUs, Brass, DaveMade, IceColdNYC, XForce, Slash, RazorBlade, GeekBoy, DummyLoad, LawBreaker, Earplugger, Toadstool, and whoever else is involved in manufacturing illegal CB amps and promoting the idiotic "sport" of Keydown Competition to turn themselves in to the nearest FCC field office and beg to be

locked up and have the keys thrown away.

(Oh well. I can dream, can't I?)

Probably the most useless topic on the planet. You already can buy higher power radios for FRS, but guess what? They eat up the batteries quickly, and the range is at best two blocks farther than stock units. Additional power does very little good on FRS.

So is it worth the $100-plus price difference? Not hardly!

>From: timnebo@aol.comedy (www.kp82.com)

>
>then why are you so interested in what happens on 11 meters? what happens
>there
>stays there and doesnt bother you.

This question surfaces about once a year in this NG.

Answer:
(1) Illegal radios cause interference to adjacent frequencies. Overmodulation spills into the 10-meter amateur band--even when the transmitting station is many miles away.

(2) CBers with export radios cannot resist the temptation to try them on every "channel". In some cases, the operator does not even realize he is in the amateur bands because the radio does not have a frequency indicator. The operator sees only switches with BANDS and CHANNELS.

(3) Some mobile CB equipment is so powerful that it kicks off the cruise control on nearby automobiles. No big deal. But what if the driver in a nearby car is wearing a pacemaker which should not be exposed to strong RF fields?

Tim says that what happens on 11 meters "stays there and doesn't bother" anyone. Wrong. It doesn't stay there. And that's why CBers are getting so much attention.

When CB stayed between channels 1 and 40, nobody cared what happened there. You never find hams or the public screaming because a CBer is using channel 19A.

But when you do things that annoy the public or which cause problems for adjacent radio services, be prepared for what you receive!

I have been watching the conversation turn to an attack on either me or what your perception of what my beliefs may be. This is solid proof that what I said in my original post, that Kwanzaa is a crap holiday, is completely true. It has been proven by those that have chosen to attack me rather than debate using the facts, it just had to come to a personal attack. There is no defending it because there is no real substance to defend. You just can't face the truth because it would mean going against the politically correct system and feel compelled to perpetuate lies and make up half-truths. More attacks against me or what I possibly believe in will only serve to prove my point. I seriously doubt you know anything about Kwanzaa or other religious holidays, other than the liberal propaganda you read in the newspaper.

Greetings!

Let's start simple...
Remove the 1/8 wavelength.

I'm willing to settle for 1.7 SWR - I don't know about you. Especially
if it's pure resistive. No sense in adding to this problem.

Greetings!

First, you might want to check the antenna, it may be assembled
incorrectly.

Did you check the mount?

Remember, the trouble with antennas, is not just the reactance.

Seeing this type of results lends be to believe that the problem lies
in the coaxial connections. Do you have an open ground or are we
measuring at the feedpoint?

Either way, the classic result is that if the antenna and mount can be
fixed first - let's do it.

How am I to trust your word that this antenna will be resonate at the
specific frequency? A 3:1 SWR - are you sure you're not seeing that
now?

Get a dual band Alinco and cut the blue wire, then reset the computer.
There you will have MURS, GMRS, and FRS with the wattage you seek.
Also, in a much better designed package than the talkabout.

Did Aaron's just blow a gasket?

And he hasn't contradicted himself here, either. There are two common stunts of coax to coax matching that I have used: the electrical quarter-wave (one-fourth lamda times velocity factor) section in which a section of coax of an impedance near the geometric mean of the source and load is used at the load -- called a Q section for reasons I have not a clue about -- and the 4:1 coaxial balun that matches the balanced effective 200 ohms or so of a folded dipole in real space to 50 unbalanced pretty well (in spite of loading the dipole with a bit of weight if one is not careful).

While the latter might if one were a bit of a sophist be said to be a contradiction, the Q-section most certainly is not. It requires a coax of *other than 50 ohms* to do its magic. By setting up a situation in which the mismatchs at both ends are equal, power is simply reflected back and forth until it gets it right -- much the same thing the antenna does in the near field to match the 377 ohm input impedance of the universe. It raises the current in the Q section a tad but not enough to be noticeable in terms of IR loss. It is, of course, extremely difficult to cause a mismatch between two pieces of coax with the same characteristic impedance so he hasn't contradicted himself one bit.

1) Dammit! Sent that before I meant to. To correct your erroneous statement, "SOME illegal radios MAY cause interference"

2) You're so far removed from reality you have no clue what is taking place. Most I know with exports can give two squats about anything in the ten meter region and above. The radio has no frequency counter? You really aren't aware of what's going on, are you?

3) If you are on a pacemaker, how much time you figure you got? Most of the new ones are chip implant controls with a sort of "default" self correcting mode when it detects something amiss. Never happened, never will, and you can't cite otherwise.

And lastly, why would the public give a flying leap no matter where one operates since it doesn't affect them? Answer: They don't, and either should you! Please explain how 19A is interfering with other radio services any more than any frequency at random.

I've read that article.... AB0PO is dreaming if he thinks the FCC will
return
11 meters to Amateurs. And hams would be STUPID if they thought all the
equipment that's been manufactured for the 11m band will just disappear
if they took over the band.

There is no contradiction there. That says there is no length of
"50 ohm coax" that will perform a match. The other example is using
"25 ohm coax" to perform a match.

As I was scanning down through the flamewars of the NG I couldn't help
but notice one of my old pals being slammed by you Boobner.
Accusing "Phoneman" of build linears is probably not one of the
smartest things you have done lately. I wouldn't want to be the one to
piss phoneman off. Those of you who have had dealings with him
personally and know who he works for know why, I'm sure.
This is one guy you want to be your friend, not foe. Trust me.
I think the exact phrase Phoneman used before he ridded the
rec.radio.cb newsgroup of one of it's more annoying pests like yourself
last time was "You know, the interesting thing about the Internet and
Newsgroups is that you never know WHO or WHAT the person is that is
sitting behind the keyboard of the computer making posts under a
certain name". THINK ABOUT THIS STATEMENT Goobner. Maybe you'll be the
next pest he turns his attention to. I'm sure it wouldn't hurt the
feelings of several of the old timers here. I know it didn't last time
he did us a favor......

JR, probably because:

A) you're hearing the minority of cbers on ten, which would probably cooincide with channel 19 on the truckers radios, and B) You're probably looking for it.

The truckers that run on ten have no clue they are even on ten for the most part. And they are in no way indicative of typical export radio users, no more than you are indicative of the, of the, the,.....just who do you crow the loudest for? And why?

4277. Psycho Alien Race and "MASS" Murders!

Newsgroup: rec.radio.cb
Date: 2000-12-29 18:56:38 UTC
From: americanmanzo@my-deja.com
Message-ID: <92imp3pbl1@nnrp1.deja.com>
Source record: 65662
Cross-posted to: rec.radio.cb,rec.radio.shortwave,alt.pirate.radio,alt.radio.uk

I'm investigating the recent shooting at the Edgewater Technology
software company?

From the looks of things it appears as if the employee was being
attacked by his "CESS Alien Co-workers". A similar
situation happened here in the Alien Agency AREA called Cincinnati.

An oriental woman working at a packaging facility(re-packing soap
products and batteries for K-Marts and other
department stores)
had an argument with a CO-worker, she then left and came back
with a revolver and a few clips___she then pump a few rounds into
various CO-workers.

They said she was on medication because she was depressed and was
having problems with here CO-workers.

I worked at those packaging facilities and most of those workers are
"ALIENS" or dead people(Aliens also). When a human
works in their presence they are attacked by the alien race. Attacked
meaning, alien hits to the brain and other parts of the
body resulting
in extreme pain, anger, and disorientation. Once the alien race
decides to attack a human___they don't stop until the human is
murdered(Taken Down Unfairly).

So, what I'm saying is that this software worker was probably the only
human on the job and he was trapped by the alien
race
(same thing happened to me when I received a phone call job offer from
a mysterious U.S. Army Colonel in 1987. I was a
graduate
student at North Carolina State University, poor, and without
many friends___this mysterious colonel called me up and offered
me the job of a lifetime. The colonel was from OHIO and this
state is CESS Alien Agency. The only reason they offer jobs to
human beings is to trap and kill them.

I'm still working on the story but it looks like another situation
where the Alien Race has violated the rights of an American
citizen. Also, note the shooters appearance. When the CESS Alien Race
attacks a human being___they refuse to allow the
human to
cut their body hair. If you shave___they deform your face. If
you cut your hair___they hit and torture you.

If you think that human beings become mass murderers because
they have money problems___think again. The are other factors
(CESS Alien Agency) that are probably the cause of the
behavior of this worker.

More information about the CESS Alien Agency and how the Agency
is taking over this country and enslaving/exterminating the human race
can be found on my investigative news magazine.

The only news magazine on the internet that publishes news articles
about the "Alien Agency" and does not articles
written by the "Alien Agency".

I need publicity because I was trapped by the RACE and my life is being
censored. Also, I am a prisoner of the RACE,
being kept on the streets of their cities.

So, I demand publicity. Use shortwave, pirate radio, cb, etc....
There are aliens here and they are abducting human beings and
forcing them to live in their HIVES___were the humans are
sacrificed. Also, please re-post!

My site is being censored so the RACE can write fraudulent history
about me and what they are doing!

Hmmmm? I wonder why the "RACE" is insisting on gun control?

The Amendments stand, including the amendment that gives American
citizens the right to protect themselves with "what-ever" means
necessary? What till they find out who the real enemy is!

Thank you,

You'd have better luck dreaming of a new year. Just dream for 3 more
days and it will be 2001. What channel do you hang on, Aaron? I'd
like to call you so you can hear how clean my stuff is. I'm a
sidebander. The quickest way to be ignored and ridiculed on sideband
is to sound like crap. But you'll never know with your little Radio
Shack AM only pea-picker with cellular look-a-like antenna.

So where is Mobile51? I've never heard 'em on my radio.

ok guys, lets just say for a minute the fcc stepped up enforcement and totally cleaned up all the illegal radios in the USA and our territories. assuming this happened what are you going to do about the hundred of thousands of people in central america, south america, and other places that are still freebanding and encroaching on ten meters??????? the biggest problem is not within our borders therefore you guys worried about cleaning up the states are looking very narrowly at a pig picture and will never even come close to solving the problem. even if 11 meters is totally eleminated it is truely a world wide band that crosses all borders and cant be controlled.

Damn, Wayne! This is old news! We have been talking to these aliens for years on our modified outlaw radios. Only the cbers can do this, as the bands where these aliens make their present known is forbidden to ham operators. Would you like me to send a message for you? The great exalted Garn himself uses a Yaesu (modified, of course) and when the northern lights are zapping us, we can do magic. You did see the movie "Frequency", did you not? Well, where do you think they got the idea? Thats right! They were spying on our transmissions cause the aliens are actually the Flintstones reincarnated, and Dino is head of security. Remember that lab in New York, the whole David Berkowitz and son of sam thing? Dino made him do it. See, what no one mentioned is the lab was wearing one of those voice command type collars and the Garn modded his rig for Dino and Dino actually told the Lab what to say through his collar. The lab was under alien powers of suggestion, much like you have already exposed. Thank you and let me know if Pebbles (Have you seen her since she grew up? Wow) gets a radio.

Sure. Fine. Easy now. Just sit down here and relax.

Is there a doctor in the room? Someone call an ambulance, please. Quick!

Oy. Now I'm being threatened by people with names like "phoneman" and
"the weak one" in postings that are simply dripping with melodramatic
touches. Honest to God, it's like a bunch of kids playing "mafia".

Next you'll be threatening to send me package bombs. And for what?
Because you want to stay illegal on CB - and I make you uncomfortable?
Not a good reason.

>"25 ohm coax" to perform a match.

The other example is using 25 ohm transmission line, which is actually two equal lengths of 50 ohm coax in parallel. Doing a quick calc for a series section transformer yields 0.825' of 25 ohm transmission line (2 x 0.825' of RG-8) followed by 2.484' of RG-8. Total length is 3.309', and total length of RG-8 used is 4.134'.

The amount of 50 ohm coax needed to match a 37 ohm load to a 50 ohm source is 4.134 feet.

Personally, I don't think Aaron has a radio. I don't think he ever really wanted to become an Amateur Radio Operator either. I think he's just a lonely little troll that hangs out in various NG's and does his thing. If I had any spare time and energy, I'd go to deja and see if he's posting anywhere else. Got a life though and can't be bothered with Aaron's antics.

RG214 is basically RG213 but with 50% more shielding (60db versus
40db) according to times microwave. We use LMR400 at work which
outperforms both RG213 and RG214 hands down for what we do
(microwave). I still use RG8X at home however. Check out

George seems to be off the beaten path due to his dreaming. MURS will
noway take over the 11meter band for CBers. At 150 and something
megahertz, the characteristics are far too different to get people to
switch over. Plus, the wattage is far too restrictive.

I foresee MURS talking over for FRS for people who are tired of the
FRS disposable radio syndrome and want a better quality HT with a
decent amount of wattage but easy on the batteries. Look for someone
like Pryme in this market early.

To more than a HT platform, MURS needs more frequencies than just four
and a maximum wattage of 25 to 50 watts.

Finally, it is no wonder why ARRL and HAMs are up in arms about the
FCC citizens bands lately. Look at it this way, CBers now have
11m/2m/73cm bands (CB,MURS,FRS). Sounds threaten to people like
George, ARRL, and some other HAMS that appear here in rec.radio.cb.

P.S. George (AB0PO) its "encroachment".

Gee, just a few days ago I ran across another goodie like that one--perhaps the two of you can get a movement going. At the very least you could try swapping your medications....

Weirdness follows:

Please take the time to read my letter. This is not a joke and my lawsuit against the United States is just about to leave the 9th Circuit Court of Appeals and go to the Supreme Court.
I am not looking for people to write me and debate the details of my case unless they can forward the information to the needed people for public disclosure or further legal proceedings.

Re: Charles A. Schlund et al, v. Drug Enforcement Administration and the United States of America et al, Case Number CIV98-1875-PHX-ROS on appeal before the 9th Circuit Court of Appeals Docket No. 00-15-126
In my lawsuit are the plans for the fixing of the presidential elections of the United States by George Bush and the CIA. In 1991 and forward I did work with the FBI and others supplying them with information on the CIA's plans and in 1993 The DEA whom I have always known as a covert operation of the CIA did obtain a warrant under perjury while I was working with the FBI and injected CIA designed monitoring and torture devices into my neck to disable me to stop me from stopping their plans to fix the presidential elections of the United States.
After all negotiations with the government failed and the government continued to torture all of my witnesses and me to cover up the fixing of the presidential elections I went to the FBI and they told me I would have to file a civil suit to stop the torture. I did and this suit is now before the 9th Circuit Court of Appeals and is about to be ruled on.

I am unable to properly continue a lawsuit of this magnitude under torture by the Justice Department ot stop me. I am heavily protected by the FBI and many others and all assassinations attempts against me have been stopped. Torture and sleep deprivation are the rule of the day and the CIA using the DEA and others believes that they will be able to cover up the fixing of the elections by the CIA by the use of torture to disable me.
I need help in contacting Al Gore's legal defense team. I need legal help in filing the parts of the appeal needed before the Supreme Court.Could you please forward this to interested parties as you see necessary to proceed with this legal battle.
The ruling by the Supreme Court was not just a legal ruling it was corruption of the highest level and I have the proof to prove this in court.

I understand that what I'm saying is unbelievable to you and it gets much worse but all of this is public and before the court and has been before the courts for four years now.
Please read one of the many letters I wrote last year, which is enclosed and it might help you in understanding my position to a very small degree. Thanks for your help. Charles A. Schlund

Request: That this complaint from Charles A. Schlund against the United States Department of Justice Drug Enforcement Administration and any other or others involved in the Torture of Charles A. Schlund be forced to terminate the torture. This is a demand for relief from torture and a demand for relief from control as filed in my lawsuit against the United States and or as listed in any of the many letters to the United States Department of Justice and or the Drug Enforcement Administration and or others. This letter is a request to all agencies of the United States to comply with Executive Order 13107 of December 10, 1998 and or other laws listed in my lawsuit against the United

States. It is further requested and demanded that my human rights complaint against the United States be addressed. I further request and demand that this letter is forwarded to all agencies of the United States government for action and relief from torture and control. This duty should fall under the responsibility of the DEA's Officer in charge of human rights. I further charge that the United States is in violation of its human rights treaty obligations and all reports should list these treaty violations. This letter is a demand for a written reply from the DEA and the United States Department of Justice on the use of torture against others and myself under cover of law. This letter is also a demand for relief from torture and other human rights violations as set forth in my letters and lawsuit case number CIV98-1875PHXROS In the district of Arizona. This letter is my complaint against the DEA and others for human rights violations against me as a political witness. It is also my demand that the DEA and the United States Department of Justice allow others and my self to give them the information we have with out torturing us to stop us from supplying information to the DEA and or the United States Department of Justice and or others.
Statement: It is my belief that the following information never should have been released to the public or others that do not have a need to know. It is also my belief that do to the inability of the United States Department of Justice under Janet Reno to stop these human rights crimes and injustices and to in act the rules and laws that are necessary to protect the American people that it is now necessary to release this information. I have threatened the DEA with the release of this information if they refused to stop using torture, control and intimidation against others and my self in the cover-up of the information they and I have. The DEA in return satanically tortured me using the cover of law to protect them from justice. The DEA will claim they are only monitoring me. This is a lie the DEA could monitor my home, truck and jobs with out the use of electronic implants injected in both sides of my neck. The only reason the DEA uses these implants is for the purpose of intimidation, threats, control, and torture and to deprive and or limit my freedom of speech under the cover of law.
Subject: The use of Torture and other human rights violations by the United States Department of Justice Drug Enforcement Administration and or others against political witnesses in the United States of America. The refusal of the United States Department of Justice under Janet Reno and the Drug Enforcement Administration under Thomas A. Constantine to stop the use of Torture against political witnesses and or prisoners in the United States of America. The fixing of elections in the United States of America by the use of covert operations. The running of drugs by the Drug Enforcement Administration and the CIA in the United States of America to finance covert operations against the American People. The use of an Electronic Torture and Control Devices to control and torture political witnesses in the United States of America by the Drug Enforcement Administration and or others. Treason against the American people and the Constitution of the United States of America.
Reference: The Constitution and Bill of Rights of the United States

of America, Protection of Human Rights Act, The Convention Against Torture and Cruel, Inhuman or Degrading Treatment or Punishment of June 26, 1987, other International Laws and other laws of the United States of America. My lawsuit against the United States of America Case Number CIV98-1875PHXROS and many letters to Janet Reno, Thomas A. Constantine, Kenneth Starr, John Albano and many others. Presidential Executive Order 13107 of December 10, 1998.

The following is my letter to all parties listed and involved, which is a demand to the United States of America to terminate the use of torture against me as a political witness against corruption in the United States of America. This is being done by corrupt agents of the United States of America and others that are knowingly, deliberately, intentionally and willfully using torture against my witnesses, others and my self. This is being done to cover-up their crimes against the American People and Charles A. Schlund. This is being done under cover of law as a fabricated, created and false investigation against Charles A. Schlund to justify the use of torture and to obstruct justice and tamper with me as a witness against them.

It is well documented that I have repeatedly demanded that the United States Department of Justice investigate my claims of the use of torture against others and myself. This torture has and is being used against me as a political witness against corruption in the Drug Enforcement Administration and others. Janet Reno and the United States Department of Justice have refused to answer or address the use of torture by the Drug Enforcement Administration against others and myself. Torture is a Crime Against Humanity and the United States Department of Justice can not pretend that it doesn't exist in the United States and allow these corrupt agents to use torture under cover of law with total disregard to Human Rights and the laws of the United States of America. Janet Reno must honor her oath of office to the American People and reply to my claims of torture and terminate the use of torture against me and others. This torture can not be allowed to be covered up under the cover of an investigation by the Drug Enforcement Administration. The DEA has substituted the word investigation for the correct word torture. Torture must not be allowed in the United States of America for any reason. Janet Reno must allow political witnesses their freedom of speech with out the use of torture to deprive them of their freedom of speech. The United States Department of Justice must stop the use of torture by anyone including their own agents. If the United States Department of Justice allows torture then they are as guilty as the corrupt agents that are using torture.

Let me start this part of the letter on to day's date 6 April 1999. I started the day by my lawyer coming over for some paper work and my brother coming over to work with me today. We sat in the dinning room and talked for a while, the DEA only tortured me on low power but it still was torture to some extent. Next I left for work and the torture mode was changed from the mode they use on me while I'm home. When I got to Edson an electrical supply house the torture was turned up and I was tortured severally and satanically. I was getting near the point of passing out. Severely is millions of times less then the torture has

been in the past. I left Edson Electric for the job I was doing today, the DEA kept me about 75% or 85% disabled at this job to deprive me of my ability to work adequately to make enough money to finance my lawsuit against them. (At this point my computer locked up and I lost some of this letter, this only happens when I'm typing letters like this or getting information they don't want me to have off the Internet).
To days date is 20 June 1999 I'm being satanically tortured with the CIA designed monitoring and torture devices that the DEA injected into my neck. This torture rises and falls depending on what I say or what I'm doing. If I say anything political the torture is increased. If I type anything political the torture is increased. If I try to repair anything around the home or do taxes or record keeping the torture is dramatically increased to stop me. If I try to go out or do anything pleasurable to me the torture is dramatically increased. If I go to work I'm satanically tortured on the way there, than after I arrive at work the torture is decreased for their photo session to generate fabricated evidence that I'm not under torture. Any time I step out from in front of their camera the torture is dramatically increased to disable me and deprive me of making a living and all other human rights. This has been and is being done to me ever since I read the files I have always called the Don Bolles Papers. These were all the CIA and other documents concerning the systematic overthrow of the United States of America by the Rockefeller's and the CIA in 1977. These were all the files that had been removed from the government and others under order of Nelson Rockefeller because Jimmy Carter had won the presidential election of the United States.
The torture of me is ever changing and varies greatly from day to day and year to year. If I complain about one kind of torture they then change to another kind of torture and then latter they will go back to the same way of torturing me. Some days they use 100's of different modes of torture against me and on other days they don't torture me so severely. Any statement made by me for that day is truthful but the next day may be totally different. At present they use torture against me every day and have for years. I have informed my torturers of the modes that don't torture me and those are the only modes they refuse to use.
Let me explain what my lawsuit is about before I go any further. I was a witness against the United States Department of Justice Drug Enforcement Administration and many others for crimes against the American People and many others. These crimes are listed as follows. The running of drugs by the DEA and the CIA to finance in part covert operations to control the out come of elections in the United States of America and for many other reasons. The creating of crime in the United States of America to justify the creation of new laws to deprive the American People of their civil rights and liberties that are guaranteed to them in the Constitution and Bill of Rights of the United States of America. The torture, control and murder of political witnesses and many others in the United States of America by the DEA and CIA and others under their control and direction. These murders included Federal Judges, Congressmen, Actors, Singers, Police Officers, Federal Agents, Political Witnesses and many others. The use of the United States

Department of Justice to authorize investigations for political reasons and to use these investigations to imprison, torture, discredit or murder citizens of the United States of America. The use of the United States Department of Justice and the Drug Enforcement Administration and others to funnel funds out of the United States of America to fund political investigations to remove witnesses and or others against the Republican Party and others under their protection or control.
In 1991 I went to the FBI and worked with the FBI against the DEA, CIA, Corrupt Judges and many others. In 1992 after the FBI had confirmed to me that they had the DEA for running the drugs in the United States. I then led the FBI into a much larger investigation into why the DEA had been running the drugs and where the money was going. Lets go back to the Don Bolles papers. In these files that had been removed from the CIA and others under orders of Nelson Rockefeller was why the DEA was formed. The following is what I remember from these files. Richard Nixon's brother had been busted running the drugs and Richard Nixon had gotten into trouble doing the break-ins like Water Gate, which was a CIA covert operation. They now needed a Federal Agency that could do these kinds of covert operations under cover of law. They formed the DEA as a covert operation of the CIA. This then enabled the DEA to do the break-ins and bugging operations like Water Gate with a court ordered warrant as drug investigations. Other covert operations like the running of the drugs could be protected by the DEA monitoring the shipments or they could just run the drugs under cover of law as sting operations. After the drug money was laundered at different location and ways like at Valley National Bank in Arizona the money could then be used to fund covert operations. This money was then used to fund political action committees and others to influence elections in the United States. Let me try to explain to you some of the kinds of operations that were used to influence the people to alter the out come of public elections. This list is not intended as my direct memory even though some of these operations were listed in the files. This list is only intended as an example to help you understand how elections can be influenced. These drug proceeds were used in part as donations to fund Pat Robinson and his TV programming, Other covert operation like the National Rifleman's Association were also funded with this drug money this was done by buying memberships in the NRA. Other moneys from the laundered drug proceeds funded the building of churches for there TV programming and others to direct the people, as they needed them to be directed. Laundered drug money was also used to subsidies the building of the cable TV network. Other moneys were used to support the American Legion who also had a political agenda. Other donations in part funded the Christian coalition and many other political action committees that operate under cover as covert operations. Other organizations like the Heritage Foundation were also in part subsidized by these donations and or by other means. By covertly funding these operations the CIA and others under their control and direction could influence the voters which helped to alter the outcome of elections in the United States. The Don Bolles papers called these operations the systematic overthrow of the United States by the CIA.

The DEA's operations included much more than just the drugs and the laundering of the drug proceeds they also directed covert operation against many of the political targets and or witnesses and they also did the bugging operations against political figures and the corporations that were in competition with those the DEA was formed to protect. After the FBI and many others had enough information the President and the FBI tried to destroy the DEA and have it incorporated into the FBI to control the corruption. Janet Reno blocked this. The FBI and others then had a law passed requiring two agencies to obtain a warrant to monitor the corporations. This was done to stop the industrial espionage by the DEA. Then they had another law passed requiring the DEA to keep its drugs locked down so these drugs could not be used as planted evidence as they have planted the evidence against me. The FBI agents then refused to cooperate with the DEA or share drug information, at this point the Director of the FBI went on the media and ordered the FBI through the media to cooperate with the DEA in drug investigations and share information.

This information is being given to you in an attempt to stop the fixing of the elections in the United States by the covert operations of the DEA and the CIA and others under there control or direction using different forms of the media and others as political action committees. You must understand that I'm being horribly tortured electronically with the implants that were injected in both sides of my neck by the DEA to stop me from being able to give others this information. The FBI, President Clinton and others with this and other information have been able to stop much of the crime in the United States. Since 1991 when I started feeding the FBI the information they needed the crime in the United States has dropped at a rate never before seen. Murders have dropped to about half of what they were and all other crimes have fallen. Death by heart attack has fallen. Death by car accidents per miles driven has fallen. Death by suicide has fallen. All other forms of assassinations have also fallen greatly. The budget of the United States has been balanced and there is a surplus and we have had one of the longest economic expansions in history.

It was not my desire or wishes to give this information or other information publicly. The DEA in its paranoia and by the use of torture against me has forced me to give this information using torture in their attempt to stop the release of this information. I don't mind dying but no one is going to frame me as a drug dealer to justify using torture against me to destroy my entire life and the lives of all others around me. The DEA has knowingly, deliberately and willfully framed me as a drug dealer to destroy my credibility and to justify the use of torture against me to remove me as a political threat; this is a civil and human rights violation. Not only did the DEA inject me with these implants but they also injected all of my witnesses and many others around me. This new technology of being able to gas people in the middle of the night and then take them for photo session with out their knowledge or consent is not within the powers given to the Justice Department. The injecting of monitoring devices and torture devices into mass populations in the United States is also not within the powers of the Justice Department.

These are criminal acts by the United States Department of Justice under Janet Reno. It is my belief that the President can't fire Janet Reno because of her never ending and on going investigations into the Democratic Party and or the President.

Respectfully submitted by
Charles A. Schlund

It's not illegal to manufacture, sell, or use as a stepping stool. It is however illegal to operate it in the CB frequency range.

Very simple to understand. But then again w/ Mrs. Reno and her suing tobacco I guess it's possible that one can hold the automobile manufacturer liable for the damages of the wreckless driver.

Is it just me or is the dumbing down of America actually happening, but they're too stupid to notice?

You know, I really have no stand or cares on the "Kwanza" issue, but I did follow the link Dave or Debby provided to their website.
Dave or Debby are without a doubt two deeply disturbed individuals.

Dear God:
Protect me from your followers.

How to go about liberal hunting. They're nearly extinct, but if you turn over enough rocks you eventually find one.

Step 1: Go into a green pasture with plenty of grass and field stone.

Step 2: Load weapon with logic and rational reasoning. Check that safety is on.

Step 3: Check that safety is on. Repeat step 3 until sure safety is on.

Step 4: Let out the liberal call: "Conservatives are right wing religious nut cases."

Step 5: Wait patiently for one to come up from the "grass" and exhale saying something like, "Nationalize all industry."

Step 6: Turn safety off, fire weapon. Turn safety on.

Step 7: Check that safety is on. Repeat step 7 as much as necessary to MAKE SURE safety is on.

Step 8: Track wounded liberal by listening for whimpering phrases like, "Socialized medicine." Or the infamous "Gun control."

Step 9: Offer free subscription to the Limbaugh Letter to whimpering liberal.

Al, ya can't have a court say there is 13 eggs in a dozen... It still wouldn't change it.

Well folks, I'm happy to say that the light at the end of the tunnel has shown itself to the Clinton/Gore administration. And thank god, it's a freight train.

It'll be nice to kill some more spotted owls and make some power plants now that GW is in... Liberals... Interesting animals. Quite the reactionary critters, not much for logic and reason... Don't build the power plant , but please keep my air conditioner and my CD Player going... Ok... BTW, did you ever notice that the guy driving the car w/ the cloud of oil smoke coming out of the tailpipe is the environmentalist... Yeah, you got it... When he stops you can see the faded greenpeace sticker on the trunk lid. Yeah, that guy.... The same one who cuts the 6 pack rings so geese don't get caught in them. It's the same guy who tosses his sandwich wrapper out his car window. Yep, same guy... Say one thing, do entirely another. That guy. Votes for Gore because he's afraid of what GW will do... Yep, that guy. The one motivated by fear instead of logic and reason... Yep... Same guy....

You ever notice that the liberals are all over Bush for alleged cocaine use, and his 24 year old DUI... But it's perfectly fine for another elected official to drive drunk off a bridge killing his female passenger AND NOT REPORT THE ACCIDENT... DWI, and negligent homicide, Senator Kennedy is ok, but Bush, no let's attack him with his 24 year old past... Interesting how the liberal mentality works aint it...

I think they rely more on the fight/flight instinct in their brains than they do reason and logic with their neo cortex portion... Quite interesting animals to watch... Almost human...

Yeah, ok pal... Sounds good... Thank god I got my space alien deterrent strips hanging from my rafters. And good thing too, otherwise there'd be more cattle mutilations than usual. And boy am I glad that I don't drink milk anymore... Since I subscribed to bad living magazine I'm afraid to go outside because of the harmfull UV rays that the sun emits. And since I started playing non competitive sports we have one more man on the field. I mean, who needs people on bases if ya don't bother to keep score right?

I also got rid of my SUV because I feel it gives me an unfair advantage in comparison to other drivers. But thank god I don't need to take my son to soccer practice in the yugo anymore. He was the goalie, but then I bought their coach a subscription to bad living magazine and he cut him because there is no sense in having a goalie.

Did you know that peanut butter has salt in it? So I don't eat it anymore. I eat my whole wheat organic bread with a cup of thoroughly filtered de-chlorinated water each day. And those damn termites keep eating my house, but I can't use pesticides because it could enlarge the hole in the ozone layer that the evil space aliens created. I still don't understand the details of the war going on between the aliens and the penguins, but the psychic readers nutwork assures me that a portion of my time on the phone with them goes to send sunscreen to the worst sunburned penguins.

And did you happen to read this months article on how second hand smoke causes the earth to plumit towards the sun!

I gotta say, since I started reading bad living magazine I've never been more afraid in my life!

You have been treated unfairly, perhaps more so than most, but your
way of coping with it is to invent the delusion that unfairness is an
inhuman characteristic. Sorry to have to break this to you, but
fairness is nothing more than a social value that many humans don't
value. You can either deal with it like everybody else, or spend the
rest of your life stoned.

Absoutely there QRM. You said it at the end of your posting. "BE PREPARED FOR WHAT YOU RECEIVE!!!" If any of these individuals here and nationwide decide to do what they do (from transmitting in excess of 4 watts, out of band or overmodulating), then its all on them. They have to pay the piper whether they agree with it or not. But its not for any one or group of individuals to blast TROLLS after trolls trying to see if something happens. "IT'S NOT GONNA HAPPEN!!!" "You can change a few, but you can't change the lot." I wish those individuals would get it throught their thick skull that "...you can lead a horse to water but you can't make it drink."

No I haven't. What have we distracted here in rec.radio.cb? What was our accomplishment? What is the big freaking DEAL??? WHAT! WHAT! WHAT! Go study... You need it!!!

I see no merit in your posting, Aaron, due to the fact that you cannot prove to yourself or anyone on this newsgroup that the Forum members build illegal equipment. Nor can you prove that a forum member is operating non-type accepted equipment even if pictures are posted on a webpage (for all you know it could be his neighbors station). All you have is HERESAY. And heresay is not submissible in court unless strongly articulated with hard evidence. And you won't get hard evidence from this forum.

Too late... already been there.

Station:
- Uniden Washington (3-4watts AM 11watts SSB PEAK), stock-mic
- 85 feet of RG-8/U coax
- homemade 5/8 wave groundplane antenna on a 30 foot crank-up (about to update to a Mastadon)

Mobile: 91 FORD Exploder
- Cobra 148GTL (4watts AM 12watts SSB PEAK) no channels because there is nobody except myself, Unit 989 and a bunch of HAMS in this town. So I don't need anything on my station to get me in trouble with any of these guys (that's if all HAMs are like N8 whiny, cry babies).
- 55 Coil and/or POWERSTIK
- Hustler QD-2 Antenna Quick disconnect
- Stargunn Mount
- No alternators and no amps (because there is no room under the hood or in the cab for alternators or batteries (trust me)... plus I got a newborn)
- Jay in the Mojave saw my mobile BTW...

Email me for pictures. I'll even put my ugly mug on the pic's to prove that I am genuine. NEXT!!!

BTW... still looking for older GrantXL or Cobra148GTL units. Truck run is in about a few weeks.

> (Oh well. I can dream, can't I?)
>

mr twist , that is what happened in 1994. the republicans took over
both houses of congress and thought they could coast on this victory.
they took your advice and 'let it go'. and look what happened. they
lost their way. these things that happened during the presidency of
these individuals must be remembered and must be talked about
continually and should be thought about by every american. this must
not happen again. do you in any way shape or form, understand just how
much damage has been done by clintonoski and his commi libs. and oh
yes ,they are commies. if you don't believe that . do some factual
research on the situation, then come talk to me about it. do you know
that these people looked the other way while the chinese stole all of
our nuclear secrets. now we give these punks favored nation status. now
they generate a profitable income off of the united states and build up
a trade surplus and turn around and spend their extra cash given to
them by us, to build nuclear missles, build up their military and pay
off their willing helpers, the dnc, aka, the clinton bank. what do we
do. we scale ours back. clearly the news media, their willing
accomplises, have for all intents and purposes, failed their duties as
a free press to report the truth. sex in the white house. that is the
least of our worries. do you know, these assholes have bought a house
just right down the street from the white house. slick's old lady gets
her ass elected by stupid people in new york, then promptly moves to
washington dc. are they going away? nope, they are not going away. the
battle is never over twist. i think that is what you are failing to see
here. now maybe you don't see things the way i do, but i can tell you,
it is not me that is lying to you continually. it is not me charging
you taxes at the highest rate since ww 2. nope, it aint me, so i am
here to say, we may disagree but i am not , i repeat , not your enemy.
the clintonistas are. and they should be talked about. and all this
must stay fresh in everyone's minds. because we all know how they
operate don't we? after 8 years of this complete and total idiot and
this election fiasco, do we know these people , i think we do. if we
don't then somebody isn't paying attention. these folks are a clear and
present danger, and i for one do not understand how the fine folks in
arkansas produced such a fool. for such a satan, to come from a town
called hope, it is such a paradox, wouldn't you say?,......cd is out....

You are, of course, correct so far as you go. The CB thing has created a mountain of el cheapo gear that is used for economic reasons if nothing else where more legal hardware is either too expensive or exposes one to the tender mercies of the local government and its tax collectors.

You may have ignored a bit of history, however. Rebel movements require communication. One of the reasons that Amateur Radio is a bit unpopular in the Middle East (except Jordan whose economic plan is to export techs to everywhere) is that the Hagganah and Palmach used Cyprus call signs (ZD6 if I recall) and Amateur freqs to fight the 1948 war. Nothing like hiding among other signals to keep the DFing and intelligence gathering at bay. There is a scene in the book version of Exodus where stolen British vehicles are being loaded on British ships in Cyprus with HMJFC numbers on them. When asked what it meant by one of the harbor patrol, the Israeli answered truthfully: His Majesty's Jewish Forces on Cyprus.

With rebel movements out the wazoo in Columbia and other places (any of which could put a serious dent in your fuel supply -- like Venezuela) it would not be too surprising if the local commandante used the 25-30 range for communication. Great place to hide among the world's freebanders and virtually impossible in a high sunspot period to even hear for more than ones desired range with the QRM. I know if I were playing Pancho Villa at

the moment that is where I would be and using Marine freqs for any long-haul coded stuff. Given that drug smuggling has replaced bank robbery for finance, along with 'contributions' from expatriates in the US, it would be necessary to contact them periodically.

As you know, I don't much care what you do but the chatter out of the southern Americas may itself be of more government concern than anything Amateurs could stir up in a million years. To deal with it might require clearing the underbrush and US freebanders sure as hell qualify as underbrush. I tend to agree about the odds of success but this has never stopped the DEA or assorted spooks before.

Greetings!

Ok, this is interesting. I realize that dealing with a purely resistive load, the issue of RC is moot.

In a typical install, the RC value is important. We see SWR issues thanks to that value - and pertains to coax lengths and antenna reactance.

It should not be discounted in the real world.

What do you think?

When you say 'communications experience', might that not also apply to folks who (apparently) just like to flame this newsgroup? Or am I missing something?

Thanks in advance for you answer and

I'm wondering ... I noticed a lot of posts from our buddy N8*** were being deleted. If I had a bunch of posts that were being deleted, I'd certainly start watching what I was saying. I notice I don't see any more posts from that individual. Is it possible he has been banned from the newsgroup? I also notice this rec.radio - I assume we should all be having fun and communicating about CB and not simply flaming. I will be watching to see how Mr Voobner replied to my post regarding his post talking about interfearing with communications being childish - I asked him if this applied to the newsgroup as well as the radio. Hmmmm ...

What is so special about the bias is none of your fucking business...

However, having talked with Dennis I do know what he has done, and know that this circuit kicks ass.

No, it is NOT a standard bias circuit. It will work volted, and works a HELL of a lot better than the standard diode clamp, regulated pass transistor circuits, or most any other bias design so far.

So, in a way, Analy Raped Ape, Yes, no other amp has bias.. Not THIS bias.

STFU and be thought a fool... Wait. You typed, and already removed all doubt.

Dick, I've a question. The problem may well be money, but I would think that a spread-spectrum radio operating in almost any cluttered space might be a good bet. As you state, with all the freebanding going on, it is likely to go unnoticed - and using spread spectrum around these areas would make it REAL hard to detect!

A. The term is called "Implied Consent". You bought the radio, and that implied that you would consent to search and seizure upon inspection of your station, if in fact it was illegal.

B. The rules of licensing still are the same, however you no longer have to "purchase and wait" for said license. Now, as soon as you purchase a CB radio, and utilize it in the manner the manufacturer meant (read this, as use the radio), you have entered into an agreement with the federal government of the US that you will abide by all laws and regulations pertaining to CB radio.

Ain't that a bitch?

Mr. Hampton,

To truly "ruin the communication experience" in this newsgroup a person would have to devise some sort of technology that would "lock up" everyone's computer while one person filled everyone's screen with whatever they wanted. So far, this is not possible on the internet newsgroups. But it IS possible on CB. And it is practiced, I might add, with GLEE by many of your fellow rec.radio.cb dwellers.

You (or anyone) have the ability to merely "filter" out newsgroup posts. While on CB, it's pretty damn impossible to filter out a bozo showing off with his splatterbox linear.

I hope this answers your question.

mr twist , that is what happened in 1994. the republicans took over both houses of congress and thought they could coast on this victory. they took your advice and 'let it go'. and look what happened. they lost their way. these things that happened during the presidency of these individuals must be remembered and must be talked about continually and should be thought about by every american. this must not happen again. do you in any way shape or form, understand just how much damage has been done by clintonoski and his commi libs. and oh yes ,they are commies. if you don't believe that . do some factual research on the situation, then come talk to me about it. do you know that these people looked the other way while the chinese stole all of our nuclear secrets. now we give these punks favored nation status. now they generate a profitable income off of the united states and build up a trade surplus and turn around and spend their extra cash given to them by us, to build nuclear missles, build up their military and pay off their willing helpers, the dnc, aka, the clinton bank. what do we do. we scale ours back. clearly the news media, their willing accomplises, have for all intents and purposes, failed their duties as a free press to report the truth. sex in the white house. that is the least of our worries. do you know, these assholes have bought a house just right down the street from the white house. slick's old lady gets her ass elected by stupid people in new york, then promptly moves to washington dc. are they going away? nope, they are not going away. the battle is never over twist. i think that is what you are failing to see here. now maybe you don't see things the way i do, but i can tell you, it is not me that is lying to you continually. it is not me charging you taxes at the highest rate since ww 2. nope, it aint me, so i am here to say, we may disagree but i am not , i repeat , not your enemy. the clintonistas are. and they should be talked about. and all this must stay fresh in everyone's minds. because we all know how they operate don't we? after 8 years of this complete and total idiot and

this election fiasco, do we know these people , i think we do. if we don't then somebody isn't paying attention. these folks are a clear and present danger, and i for one do not understand how the fine folks in arkansas produced such a fool. for such a satan, to come from a town called hope, it is such a paradox, wouldn't you say?,......cd is out....

Thanks MR.137,

Awesome! I knew if I tried hard enough I could get ONE person to give up the illegal CB life. Thank you so much for seeing the light and having the guts to post about it. You are to be congratulated on this bold move. Although you may be now criticized by your former friends for turning away from the dark side, remember that you always have a friend in Aaron Voobner.

Sincerely,
Aaron H. Voobner

Hello Dave: RG214 is very close to RG213 or RG8 coax in performance.

There isn't really any need for such expensive coax for a CB or ham antenna installation. Unless you run across it for cheap.

The RG214 has two shields instead of one like in the RG213, and the center conductor and the two shields are silver plated. I have bought surplus RG214 at the TRW swap meet, for its silver plated shield wires, to make bitchen solder wick, wind torrids, ground fenders and fire walls of my vehicles, and a bunch of other uses.

The RG214 is a hole lot more money as compared to RG213, its said that it has a better shielding property than the single shield coaxes.

The ARRL Antenna Book suggests you use a double shielded coax such as RG214 for greater isolation to reduce unwanted coupling of RF energy between tuned cavities for repeater use.

Jay in the Mojave

>
>
>Ain't that a bitch?

If the FCC only suspects illegal operation and does not have proof
then you are not held to the Part 95 inspection clause.

Once approached by the FCC one only needs to deny operating, or
owning any CB radio. With this reply they have no right to inspect
unless they have undeniable proof. It is highly unlikely that they
would have this on the first visit. They must then regroup. This will
give you time to make sure your house is in order.

For the same reasons it is not smart to own a CB. Operate a amateur
radio instead. Then you can only be held to part 95 rules if you are
caught transmitting and not for simply owning a CB radio.

No doubt about it. All a question of what you need done, how much you are willing to pay to do it, and what sort of technical talent you have available. Would not be too surprising if some of the high value-added operations (drugs, for example) are in fact done this way. Probably not necessary for tactical ops by the peasant patrol. You also do not want hardware falling into the hands of the government troops where it might be reverse engineered. So the peasants get a modded CB and an AK to bury.

I would not underestimate the gear available to DF even spread spectrum so hanging in crowded areas would still make sense. Makes even more sense to help create the crowd. But it is still a fair bet that most of it is just low cost communication.

Hmm, I don't know how you built your J-pole, but the
VHF and UHF designs all just take the coax and hook
the 'hot' lead to the long radiator, and the shield to the
short radiator about 1/10th wavelength or so above the
junction. Then slide the feeds up or down to tune. And
it doesn't really matter if you swap center and shield. In
fact, most people who build 'multi-band' J-poles with
multiple feeds usually hook all their 'shield' connections to
the long radiator.

I've also seen J-poles coupled with a 'loop' with a series
cap. This 'loop' is laid over the junction with an insulator
to couple to the two forks. But this would take a picture
to show how it's done, and I'm not sure how practical
it is, as I've not tried it.

Oh PUHLEEEZE... This "healing of america" mentality is not the correct stance to take on the matter. I could care less about the liberals and their agenda. The point is that we're not going to let a few squirrels and racoons get in the way of progress. It's because of the environmentalist whackos out there protesting building new power plants. But gosh, they sure get angry when the brownouts start to happen.

You CANNOT and SHALL NOT have a double standard. You CANNOT and SHALL NOT have it both ways.

And NO I WILL NOT stop my typing under the guise of "healing america" because what you're hoping will happen is that we'll forget about it and drop it.

You try to count and re-count and count again until the vote turns out in your favor... And do it under the guise of counting every vote. Interesting scenario... Nope, no more disguised agenda... Knock down the trees, build the power plant, and drill for more oil. I'm all for it, and I'm not going to forget about it.

Sending attorneys to "fix" the election. And most people are wondering, "Well gee, Gore won the popular vote."... We live in a DEMOCRATIC REPUBLIC, and not a pure DEMOCRACY, and if you so much as even suggest that the electoral college be disbanded I'll be sure to type as many keys as I did DURING the election.

No go read the constitution, and bill of rights. Learn it, and live by it, DO NOT change it.

The 2nd ammendment is the reset button for the US Constitution.

Yeah... I almost FORGOT about that one... Yeah, you know what... You can't hold liberals responsible for their actions. I mean, it's fate right? Free will? Oh, that's just an illusion... So if it's fate, then we should let all the prisoners out. I mean, their actions we pre-determined right?

I mean, can't we be compassionate and show some understanding... Just like that guy in Boston that wasted his coworkers and associates... He didn't really mean to pull the trigger, those weapons just went off by themselves...

How about that unibomber guy? I mean come on... He was just sending packages to people to show them how to build bombs... He didn't really mean for them to go off...

No wait a minute... It's free will... Lock em up, vote em out, deal with the problem not the symptom.

Who in the heck is the "phoneman" and what "good name" of his have I ruined? Some anonymous guy named "phoneman" posted something in favor of CB amps and I asked him if he manufactured them. So what? Is the FBI now going to look up the name "phoneman" in the telephone book and go locate and harass him based on an internet posting? Get real. Brother, you people are WAY too touchy about this amp thing and WAY too eager to squash discussion about them.

Nonplussed,
Aaron

heehhehe..I hear yer point of view loud and clear CD. As you well know, I ain't a fan of either side, but in my mind, if we're gonna keep reminding people, a blowjob and whitewater pales in comparison to Iran-Contra and the S & L pyramid.. I tip my hat to you on the Chinese secret exchanges, or shall we say treason and espionage? It goes so friggin' deep on both sides I don't give a damn about either party. One thing I always say, we the people elect who we deserve. New York, well, lets just wait and see....we'll do well here, never a doubt in my mind, Jeb HAS to trickle down wealth to his guvnorship (sic) in the 'pile. You think Byrd from WV has the market cornered for pork? You ain't seen nothing yet! Yep, Fla., Tx., a few others are in for a prosperous time, no matter what occurs elsewhere, to a certain extent. When we talk about the evils of the past 8 years, yer preachin' to the choir, my friend. The amount of incarcerations for nonviolent offenders reached record heights during Reagan and Bush, via the war on drugs (read: people), at 1.2 or .3 million. This was their legacy due to property forfeiture, expanded police powers and abilities, and an expanded prison system to house these government created criminals. Clinton came along and perpetuated this stinkin' farce and acclimated the numbers to 2 million incarcerated during his term. During the Reagan Bush years, the assault on our Bill of Rights began. Clinton shredded what was left him. The strategy by Clinton was indeed brilliant, but he cannot take credit, credit was due to the Reagan Bush era, and in part, the economy included. The plan was this: Incarcerate by three quarters of a million, build new prisons (adding to construction jobs) add a few million to maintain the entire infrastructure, and as a result.....bingo...a low unemployment rate and a booming economy.....paying for it all was that great little tool made popular by the Reagan-Bush area....forfeiture...which in turn has countless abuses in and of itself. They both suck CD. We all have our opinions on who sucks worse, but it would be a cold day in hell before I endorsed either damn one!

Look Vesterling, I don't give a DAMN who is president at this time. Furthermore, for every bit of dirtyou can bring up on a demo, I can do the same thing on a repub., or Independent, or a damn Whig if ya' wanna go back far enough! But since YOU brought it up, and you continue to ASSume I am a democrat booster, sine you continue to use the word, "You", directed at me, when talking about the ballots. Yes, I am in Fla. You read the constitution Vesterling, the Fla. constitution. No matter what happened here with the ballots, the Supreme court (and maybe rightfully so) exercised Federalism and that is what the election succumbed to....FEDERALISM! I don't give a damn who won at this point, it is how. Keep the amendments and constitution, but trash the states" Constitution. One more time, since you obviously are trolling for anyone who disagrees with your ass kissing republican ways (funny, when I was a staunch supporter of the party, we thought for ourselves) I am no fan of either. They both suck and so do you if you can't comprehend I have no intention of supporting disbanding the electoral vote.

well doc, it happened about 4 years ago i think. a guy was using the
newsgroup to sell stuff and he was ripping folks off, so one day, he
ripped off the wrong guy. some truck driver got mad about his rip off
ways and sent him a mail bomb for his trouble which blew up when opened
killing the internet thief and injuring his mommie. well i am all
choked up you know. the guy deserved it as far as i am concerned but
the guy that sent him the device is probably breaking rocks at
leavinworth prison for a very long time. oh well, and so it
goes,......cd is out.............

That sounds kind of sleazy, Tnom. It is the kind of thing drug dealers
do when they hear the cops coming. It also sounds very nerve-wracking.
Always worrying about getting busted, and what you'd do and say if they
caught you. Ick.

Why not just get legal like Mr.137 did? It's easy.

I can't believe he would bother with EBay, knowing he has
a ready customer. He must be trying to milk it for all
it's worth.

Did some research. This newsgroup has a long and infamous past. Excerpts from a 1998 WIRED magazine article.

Enjoy,
Aaron Voobner

Chris Marquis was a 17-year-old Vermont hustler running a small-time scam online. His virtual business was going great - until somebody killed him.

By Scott Kirsner, WIRED MAGAZINE

On the afternoon of March 19, 1998, a UPS driver named Armand Gevry delivered a cardboard box to the pea-green house at 3 Washington Street in Fair Haven, Vermont. Gevry lives two blocks away, and when Sheila Rockwell opened the door, she recognized him as the deliveryman who often brought shipments of citizen's band radio equipment to her son. It was a cold, gray day outside - light snow changing to sleet changing to rain - so she quickly took the package from Gevry, thanked him, and shut the door. Rockwell, a weathered woman of 52 with hard blue eyes and wispy brown hair, carried the box down the hallway of her modest home. Chris Marquis was talking on his new Ranger RCI 2990 radio with his girlfriend, Cyndi McDonald, when his mother brought the package into his wood-paneled bedroom. His 6-foot frame was hunched over the microphone on his desk, his dirty-blond hair was swept forward across his forehead, and a thin mustache fuzzed his upper lip.

Rockwell handed the 2-foot-long box to her son. She didn't recognize the return address, so she sat down on Chris's bed, curious to see what was inside.

Chris continued chatting with Cyndi. The name and address on the box - Samantha Brown, 1863 South High Street, Bucyrus, Ohio - didn't ring any bells for him either.

"I got a package in the mail," Chris told Cyndi. He'd met her two years earlier as a quiet, sweet voice on Channel 1. Cyndi was now in the 11th grade, a year ahead of Chris, but she attended school in Whitehall, the next town over. Their favorite date was a meal at the McDonald's on the far edge of Fair Haven.
"What is it?" Cyndi asked. "Who's it from?"
"Hold on. I don't know," Chris answered, as he grabbed his jackknife from the holster on his belt and slit the box open. Inside was a slightly smaller box made of styrofoam.
"Well, it's probably a bomb, then," Cyndi joked.

The explosion knocked Chris and his mother to the floor.

"Chris had a message up," Sischo, who lives in Michigan, recalls. "It said, 'Anybody looking to buy, sell, or trade radio equipment, email me.' I had some stuff that I couldn't sell around here, so I was gonna do a trade." After corresponding by email, Chris taught Sischo how to use Mirabilis's ICQ software so they could chat in real time. They discussed the relative merits of Rangers and Unidens and Cherokees and Cobras. Chris, who used "Psycho" as his email name and CB handle and dubbed himself "PhantomOp" on ICQ, revealed his real name to Sischo. He also griped about his wife, sent a digitized picture of his daughter by email, and pointed Sischo to a Web page he'd set up to advertise the CB Shack.

Eventually, the two began trying to work out a trade. They agreed that Chris would send Sischo a Galaxy Saturn Turbo worth about $700, a couple other radios, and a few microphones and accessories. In return, Sischo would send three radios and microphones to Chris. Since the gear that Sischo was sending Chris was of lesser value, he also included a check for $100.

After exchanging tracking numbers with Chris so each could verify that the other had, indeed, sent the equipment, Sischo shipped his box by UPS in early March. But when Sischo visited the UPS Web site and punched in the 18 digits Chris had given him, he got the message "Unable to track shipment." He checked the number and tried again. Same thing.
Certain that Chris had intended to con him, Sischo called UPS and stopped delivery. He spoke to a representative of the company's security department, who asked whether Sischo knew anyone else who'd been burned by Chris Marquis. Sischo said he didn't but promised to see whether he could find others.

Sischo began posting messages around the Web and on Usenet groups. "Everyone who has been ripped off by Chris Marquis Email me immediately!!" he wrote to the readers of rec.radio.cb on March 14. The responses came quickly. Sischo heard from three or four people who had lost radios and money to the "proprietor" of the nonexistent CB Shack. One of them was NCTomCat, an America Online user who reported that he'd sent $25 to Chris to cover the shipping costs of a radio that never arrived.

In addition to emailing Sischo, TomCat was posting threatening messages on rec.radio.cb. "He ripped me off too," TomCat wrote on March 16. "I am posting ads about that crook all over the internet... the address I have is Washington St. Fairhaven Vermont... DONT MAIL THIS LIAR ANY MONEY OR YOU WILL BE POORER BUT WISER!!!!!! If I can find someone to pay the 2 way airfare, I will go there and collect everyones money back, and give him some severe dental problems to deal with... Are You listening Chris?? When You see a 6 foot 5 inch dark haired man at Your door, You better duck 'cause I will be about to drop the maul... on You noggin dude......."

On the rec.radio.cb newsgroup, TomCat insisted he "was mad but not a killer." He liked to hunt, according to Don Chilson, pastor at Pierceton's Bethel Baptist Church and a golfing buddy of Dean's, and he took tae kwan do lessons at an academy next to the grocery store in Pierceton. He'd also recently configured his computer to access the Net.

It was online that Dean first encountered Chris Marquis, according to Gonzo. Chris had confided in his friend about his dealings with Dean. He'd told Gonzo about a fantastic trade he'd negotiated with a guy in Indiana: a Ranger RCI 2990 in return for a Cobra 2000 CB radio. The RCI, a sleek, rack-mountable black box, was a 10-meter amateur radio that had been modified to handle CB transmissions. Another hack enabled the radio's user to "freeband" - go outside of the 40 channels the FCC allocates for CB transmissions. A compression board had been installed to boost speech levels. "It was the loudest thing on the air," says Gonzo, who estimates that all the enhancements bumped the radio's value up to nearly $800.

What was strange about the trade was that a Cobra 2000 is worth only about $400. It's an older radio - all brushed steel and simulated wood grain - an emblem of CB's 1970s heyday, when Smokey and the Bandit and C. W. McCall's populist trucker anthem "Convoy" made the once-obscure hobby suddenly hot. Gonzo was puzzled; why would someone trade a radio worth $800 for one worth half as much?

When he visited Chris, Gonzo saw the 2990 Dean had sent. Then Chris told him that instead of sending Dean the Cobra 2000 he'd promised, he had shipped a Realistic mobile radio that didn't even work just so Dean would have a tracking number as the two shipments crossed in the mail. (Apparently, Chris had learned a lesson from the deal with Sischo.) As soon as Dean had gotten the junk radio, he'd started making threatening calls and sending hostile email. In one message Dean said he was coming to Vermont to sort things out.

As Gonzo recalls it, as soon as he and Chris were alone, the teenager confessed to worrying that Dean would show up at his door. Dean had just called again, he told Gonzo, but his mother had covered for him. He asked what he should do; Gonzo advised him to give the radio back. But a short while later Chris was upbeat again. Gonzo noticed that the boy always felt sure his mother could protect him from any real harm. Indeed, when Dean had called that day, Rockwell had blithely told him her son wasn't in Vermont - she said he had been thrown in jail in another state.

Maybe Chris Marquis never understood that his actions could have consequences. Perhaps he thought his online identities would somehow shield him from real-world harm. He was Psycho, or Taz, or PhantomOp. He was also proprietor of the CB Shack, 27 years old, married. If no one could figure out exactly who he was, then how could they get to him? His fluid sense of identity may have made him feel invulnerable.

Even when people like Mark Sischo and Chris Dean began closing in on the real Chris Marquis, the teenager still felt he was in control. When

Sischo began sounding the alarm on rec.radio.cb and the RCI Federation site after he'd been burned by Chris, the youth had countered with a message of his own. Sischo was simply upset, Chris explained, because the CB Shack wouldn't sell him a radio he wanted badly. Even when an angry Dean started calling, started threatening to come to Vermont, the teen never felt he was in serious danger. If all else failed, his mother would handle it for him.

And what of the man authorities say murdered him? If the criminal charges are true, Dean made and mailed a bomb, taking no other precaution than making up a name, Samantha Brown, the girl from Bucyrus, Ohio, from whom no one would expect to receive such a nasty surprise. Maybe it was easier to imagine killing someone he had never met. He tangled with Chris on the phone, by email, and over ICQ. But he never saw the teenager's face. Maybe his fluid sense of identity also made him feel invulnerable. Catch me if you can.

But think on..... give an american a gun and he HAS to try it out to see if
it really does kill people. The american gun laws(or lack of them) is a
complete farce.

Just a thought..... Instead of all this inflamatory stuff, would'nt
you do your group a better service by offering your sage Tech Class wisdom
in a positive manner to guys like say me.....who are struggling with the
"code" portion of the test.
I dont want to be stuck on 70cm,1.25,2,and 6 forever.....and I damn
sure dont want to "Dog" the guys in this group who have helped me several
times with setting up my gear.

As always just my opinion,
Ken

4402. Pro-510 NEW Tune Up info?

There is absolutely no reason to dredge this crap up again. Unlike you, many of the people on this group were here during this tragic incident, so while you are acting like it is some incredible discovery of the skeleton in the closet, it is merely very sad old news to the majority of us. There are aberrations of all sorts every day, everywhere. It's not right, but neither is stirring the pot daily with inflammatory bullshit in order to elicit a response, and to keep one's name (albeit some Walter Mitty-ish screenname persona) in the headers solely for the purpose of self aggrandizement. Go away. Quickly.

Note to the rest of us: Ignore him. I generally do, but couldn't help myself. Eventually he will go over to the scanner group or some other place where he can get attention.

4404. TATTOO SHOP

Newsgroup: rec.radio.cb
Date: 2000-12-30 13:49:01 UTC
From: icecoldnyc@aol.comICECOLD
Message-ID: <20001230084901.23864.00004045@nso-fl.aol.com>
Source record: 65887

A most distinguished looking lady walks into a tattoo parlor, and sits down.

The owner, amazed at seeing such a sophisticated woman in his seedy tattoo shop, goes over to the woman immediately and asks if he could help her.
To his
shock, and utter delight, she lifts her designer dress, and points to her left inner thigh...very high up....
" Right here," she says, "I want you to tattoo a turkey with the word 'Thanksgiving' under it." Then she points to her right inner thigh...just as
high up, and says,
"On this side, I want you to tattoo a Christmas tree, with lights and tinsel,
and an angel on top, and underneath the tree I want the word'Christmas'.
The tattoo artist looks at her puzzled. He says, " Lady it's none of my business, but
that is the most unusual request I have ever had. Why in the world would you
want that ?"

"Well," the lady said, " I am sick and tired of my husband always complaining that there is never anything good to eat between Thanksgiving and
Christmas."

Source record: 65801

No CD..it goes way deeper than that. If I choose to indulge, it's no one's business what I do in my home, or my bedroom. I make my choices based on what is good for my kids, not necessarily me. I choose not to do drugs because I don't want to be a hypocrite to my children. Same reason I don't drink. When my kids are grown and on their own, if I want to suck fumes from a lawn mower, or shoot ketamine in my jugular, it's nobodies damn business. I don't personally think said acts are healthy, but you damn sure ought to have the right to it.
The medicinal purpose is 100% valid, I have seen it first hand and just recently lost someone young and very dear to me to a nasty form of cancer (multiforme glioblastoma stage 4) a horrible cancer of the brain, which is always fatal and sometimes extremely rapid. There is no cure and typical treatment and therapy offered no relief. But surprise, surprise, guess what did? That funny little plant I haven't given a thought since college days. SO yes, I am very compassionate when it comes to the government sticking their nose in private affairs and perpetuating hypocrisies upon the masses, for our own good of course. The demos were worse, Clintons era proved it. Each are compassionate to their own agenda, and the rest of the world be damned. Many other issues appall me as well, CD, and I do what I can to make a difference. So in a way, yea, I agree,we must never forget what these parties did, and did not do for the U ESS of AAAY!

4413. For sale SSB base/Turner plus 3

Newsgroup: rec.radio.cb
Date: 2000-12-30 14:57:06 UTC
From: Bill <wdecker1@rochester.rr.com>
Message-ID: <6Jm36.71257$7I.9000735@typhoon.nyroc.rr.com>
Source record: 65896

A very very nice SBE Console II base rig, 23 channels with the very common crystal bank addition to expand frequency coverage to 40 channels and then some. (.605), radio works beautifully, looks great as well, wonderful audio reports on both AM and SSB, one of the best receivers I have used in a long time, includes original manual and literature, and a nice Turner Plus 3 amplified desk mike. This one will run right alongside any CB out there, and is a ball to use. There have been a couple of these on eBay lately drawing some pretty good money for the rig alone, and the mikes are holding strong money as well. $100 shipped and insured to your door, ppd. MO only,or will swap for SSB mobile or Export mobile in good shape.

email replies please

4414. HR2510 FS/trade

Message-ID: <kVm36.71263$7I.9007125@typhoon.nyroc.rr.com>
Source record: 65800

Have the following: Cobra 139 23 ch SSB base, cosmetics great, won't power up might be something simple, might be bad, excellent for someone who needs a clean parts rig or to restore, haven't even pulled the fuse holder to check that far!!

and a HyGain IV 40 channel AM rig, works fine, looks bad, with PLL02a chassis for easy conversion and big peaking. Nice rig for the shop, including hand mike.

$35 plus shipping for both,or swap for a good 40 ch mobile, programmable scanner in working order.

email replies please.

Two of the alternators have only slightly more than
tangential contact to the chain. Are you concerned about
gear slippage because of this, especially after a new chain
automatically stretches after a few cycles.

Can't tell if it's in the pic, but have you thought of using a spring
loaded tensioner?

>

Absolutely true. Reality is that you keyclowns are ILLEGAL. Stupidity is that you think it is no big deal.

You keyclowns' days are numbered. I can't wait to hear your whining when you get busted.

By the way, I am not banned from the NG and I am not Voobner.

You gutless weenie munchers are the ones hiding behind assumed names, etc. I use my callsign and my info is for all to see.

It is wishful thinking on the part of some poor sad squirrel turd munchers and their ham operator buddies who suck ass with them to think I am banned. You hams that
support ILLEGAL operating are a disgrace to the hobby, as are the ILLEGAL operators here. All you keyclowns are gonna see soon enough that your ILLEGAL activities will be punished by law. I will be laughing my butt off on that day.

BYE BYE FOR NOW KEYCLOWNS.

I have a 3alternator bracket for sale. Use 2leece Nevilles and your stock alternator on the bottom of the bracket. It has all of the pulley's on it already. The bracket is made for a 350 Chevy engine. All you have to do is bolt it right up to the face of your engine and install your alternator's. I bought it for $385 but will let it go for $275 you pay shipping. Mr.Pastor Blaster Praising The Lord

Wish you guys luck. All he is doing is stating the obvious and waiting
for the large mouth bass to jump.

Kind of reminds me of the Polish Orange Order in the Communist days. They
would gather and march to the zoo to sing Marxist-Leninist songs to the
monkeys. The police were firmly convinced something about this had to be
illegal but had one hell of a time figuring out just what it might be.

Cut the nonsense, Bill. Unlike you, a lot of casual readers of this newsgroup are not at ALL familiar with this story (as I was not). Why do you desire to hide the fact that a death occurred as a result of a feud in this newsgroup? I think the story is very relevant to this newsgroup today, as I see threats similar to those made to Chris Marquis made in this newsgroup all too often.

Those who ignore history are doomed to repeat it.

Your humble servant,
Aaron H. Voobner

I am a 6 meter op who has just fallen in love with PSK31.
Seeya on 50.290!

Also, I am totally opposed to ILLEGAL CB operation, and
am really glad about the law that was signed recently that
gives local governments the right to make or enforce local
laws against the illegals. One of the groaner experiences
of ham radio is having someone see your setup the 1st
time and say "Oh, YOU are one of those guys who tear up
my stereo and TV!"

It was high time something was attempted to get these
public nuisance type operators, with their ILLEGAL radio
equipment, under control. They are a nuisance to the
general public and ILLEGAL!

It had nothing to do with a "feud" in this newsgroup
It had everything to do with fraud to another individual outside newsgroup.
You are attempting yellow journalism.

Obviously the response of the "Cultural Elite SS Alien Race"!

If you are human it would be very sound advice to access
my news magazine and make some hard-copies. Study the material
until you understand exactly what it means.

And what it means is___if you are a human being___
they will eventually snuff you and your family.

The agenda of the collective alien race is the complete
extermination of human beings.

So, I'd get on your CB and start jabbing!

I've got to hand it to N8WWM. No matter what else he's done, you have to admire the fact that he's legal and proud of it.

I seriously doubt that we will EVER see a photo, a name, a legitimate mailing address and *grid coordinates* for ScottUnit69, ICECOLDNYC, kp82, Brass, Jay In Mojave, Mobile51, Curious Dan, Pinhead, or any of the other loudly bragging illegal "regulars" in rec.radio.cb!

Busy, busy, busy little fingers, Scott. Seems every time I turn around
you are doing some kind of Voobner search. Or writing about Voobners.
Or thinking about Voobners. That's why I thought you should meet some.

> I could buy a second hand uniform at the thrift store!

Nice! That would be fun for you I bet. You could play soldier.

Hi Ice,

Maybe you can help me clarify something. The whole idea of "swing",
what is it exactly? I mean, I have seen the meter bouncing around on my
CB when heavily amplified and distorted illegal miscreants are saying
swear words and trying to mess up the channels (which they do). Why is
this a good thing? It doesn't seem to help their transmissions in any
way. I mean, they still sound awful and overmodulated. So is this
desirable? I mean, is it considered "good" to sound like crap and be
rude and ill-mannered?

I don't get it.

PS> Also explain the apple tree thing. Is that some kind of crude sexual
reference?

Thank you,

Aaron H. Voobner

I have a better idea. Tell us what you profess to know, how you have "inside" connections, and let the people decide whether to believe you or not. I for one, know better, and no amount of crying, sniveling, whining, bitching and moaning is gonna change your wishes to reality. Local ordinances must first be enacted before they can be enforced.

Wish you guys luck. All he is doing is stating the obvious and waiting for the large mouth bass to jump.

Kind of reminds me of the Polish Orange Order in the Communist days. They would gather and march to the zoo to sing Marxist-Leninist songs to the monkeys. The police were firmly convinced something about this had to be illegal but had one hell of a time figuring out just what it might be.

Fellas, the time will come that you all wish you had never operated illegally.I
am kind of close to the source, and I hear rumors of some serious busts about
to come down.

On this end I will chortle as much as Voobner and N8 have been. You guys think
you are bigshots posting all your foul crap, but all you are doing is letting
those 2 guys yank your leashes. Hell, N8wwm OWNS you guys, and you all worry your little heads everytime he posts. What a laugh.

The idea that you can keep getting away with what you are doing will be dispelled soon enough. That will be fun to watch.

RILEY WILL GET YA!

Just to let everyone know, My X Force Amplifier is still for sale. It is the model X60012, with 2) 2sc2290's for the driver section, and 6) 2sc2879's for the final section. It has the ("#12" designed) Biasing Circuit, Single SideBand Delay, Variable Power, Recieve Amplifier, and Upgraded Power Leads. I bought the Amplifer NEW, about 6 months ago. It has never been abused, over driven, or over volted. The original Transistors are still inside. Price is negotiable. Maniac.

Milking it for all it is worth? I have responded to more than one post
in the last six months looking for this item. When I sell anything, be
it a radio item, a car, a camera, etc., I sell items that are in mint
condition and well cared for. Example: When I sell a car, everything
works, all maintenance is up to date, all repairs have been made and the
body does not have a door ding on it! Should I sell this car to someone
for the price they would pay for a car in average to poor condition? Not
going to happen! When someone buys a car from me they will pay more, but
they will get a car in exceptional condition. If you want a VC-200 that
has been in someones Jeep for 4 years and is well worn, then buy it at
the price he will sell it to you for! If you want a one of a kind, new
VC-200 with box and manual, then make a bid. I keep my stuff nice and I
have never sold an item on ebay at any price that I did not get thank you
emails for. A higher price is what you will pay for anything that the
owner took the time to keep it nice. It is not a matter of milking it,
it is just a matter of getting paid what something in mint condition is
worth!
So a word of advice: Next time you go looking to buy a car, buy the car
that the owner took the time and spent the money to take care of, not the

lowest price. I change my oil every 2000-2500 miles...how about you?

You've got a strange feeling for what's important, my friend.

You're "appalled"? If you're going to be "appalled," then be appalled about something like the existence of hungry and diseased children, or the horrific (and continued) wars of this century, or the existence of slavery in the world (yes, it still exists).

When you tell us that you're "appalled" by abuse of the CB spectrum, then we doubt whether we should take you seriously -- about anything.

Or we just decide that you're a fool and a jerk, which is what many of us seem to have done.

Ah, Mr. Clouseau,

You have touched on a most peculiar phenomenon, and one that interests me greatly. Namely that illegal operators and/or criminals of all stripes often try to deflect attention away from their abuses by pointing out that there are much greater abuses taking place in the world. For example when a purse snatcher is caught he will invariably whine and ask why he's being picked on. After all, there are murderers and drug dealers loose on the streets. The purse snatcher feels he is being unfairly persecuted. But if you examine the situation carefully, as any reasonable person must, you will conclude that the purse snatchers argument does not hold water.

How would you feel if you called 911 to report a drunk driver weaving up and down your street and the police told you that they would not respond because there were much more heinous crimes in the world like hunger, disease and slavery?

As I have stated before, I am here merely to inject a note of reality into this discussion. The point that illegal radio operation infringes on the rights of legal operators has been made again and again. Yet, time and time again I hear the same arguments made IN FAVOR of illegal operation. I can only conclude that hard-core illegal CBers are involved in criminal behavior already and as a result, gravitate like ducks to water to the criminal attitudes that go along with that behavior.

If you are near St. Mary's County you could meet my aunt and uncle. There is a Friendly's Ice Cream place they like to go to that would be ideal. However I would insist on a couple of things. #1 is that you would have to first provide a phone number where you can be contacted and a legitimate name (other than "Rat Bastard"; my aunt and uncle would not appreciate rude behavior of any type). Since my uncle is an ex military MP your ID would be thoroughly checked out before they agreed to meet you. I also think it would be appropriate for you to offer to pay for the meal, and/or any refreshments that both my aunt and uncle would like.

Let me know.

Aaron

arrange
> it for me?

If you are near St. Mary's County you could meet my aunt and uncle. There is a Friendly's Ice Cream place they like to go to that would be ideal. However I would insist on a couple of things. #1 is that you would have to first provide a phone number where you can be contacted and a legitimate name (other than "Rat Bastard"; my aunt and uncle would not appreciate rude behavior of any type). Since my uncle is an ex military MP your ID would be thoroughly checked out before they agreed to meet you. I also think it would be appropriate for you to offer to pay for the meal, and/or any refreshments that both my aunt and uncle would like.

Let me know.

Aaron

<< But what calling channels do you use? >>

Well we don't have a hard and fast rule for call channels in the USA. It used to be (back in ye' olden days):

11 - call channel
9 - emergency
12-14, 23 - base to base or base to mobile

Now that was a long time ago. Today it's more of a regional thing. We use 14 and 17 in my area but go 20 miles north of here and they use different frequencies. 19 is still pretty much trcks drivers. Along some of the Interstate highways they use 15 and 17 as well. Depends on where you are.

35 thru 39 are pretty much reserved for sideband here and occasionally 40.

So, I was right! members of the Voober Clan are predisposed towards anal
behavior. Explains a lot about you and yours. Potty training night must have
been a horror around the Voober household.

I was just joking around about the radio. The one that I bought at the hock shop was a pretty good radio, as a matter of fact, I sold it to someone on this news group about a month ago for $200.00 and he likes it. You might want to keep it around for a few more years and see what you can get for it then.

I was on DSL until cable became available to me in my neighborhood. My area was just finished up within a month ago and I was one of the first to sign up. Saying that DSL service SUCKS ASS would be doing a grave injustice to ass sucking. If cable is available to you in your area.....GET IT ! ! !

If I could tease a bunch of you at the same time I would do it too. What I don't understand is why some of you haven't figured it out yet. If this were on the radio these two ducks would be running 5 watts and you could probably carry on your QSOs whether they were in there or not. For the most part I will assume that this is not a new issue with any of us on the 11-meter band. I'm not going to name anyone but I am very disappointed with some of those the continue to reply to these obvious troll posts.

As far as aaron & n8wwn, don't bother to reply to me, when I replied to your posts you ignored me.

.......ain't taking a damn thing back!

The midland 79-820 is great little handheld that has a mobile adapter to connect it into car power and an external antenna.

This basically turns the radio into a unit with all the controls on the face.

I love this radio as it has scan, dual watch, instant 9/19, and weather channels to boot.

I think it has 4 memory locations too. The reason for that is it can be modified to 400 channels and gets a bit cumbersome to operate through all those channels.

For the price its a great little unit.

model 79-822 comes with that adapter

I've used it on many trips and works great with it's full legal power when connected to the cars electrical system

Hello Jeff: Yeah I'll bet that thing sounds bitchen.

Hello Brass: Now did we do our engineering homework? I'll bet there's
room for another alternator or two!

Just trying to help.

Klattu!

No black helicopters are available today.
The AlGorythm reboot/ repositioning proagram is in full operation.

Is the beam up code for the implant bay 7(sqr rt pi)x7 or 8(sqr rt)x7?

My Eagle Sidewinder 400 has been in the closet for 3 months because I got a new Grant XLT. I took the old Sidewinder out last night, hooked it up to the A99 and power supply, went to talk and got a little puff of smoke out the back and a nice wif of burning electronics. I looked inside and found R125 completely burnt to a crisp. It even blackened R135 next to it. It still receives but doesn't transmit. Everything else works on the radio including the PA. What does R125 do, why did it "melt down" and can it be fixed? Thanks....

This is all wrong. Are you sure you are even talking about a
series section transformer? What you describe simply does not work.

Show us your quick calcs.

Just answer the question. You said coax length trim can help you
if you have a reactive jX component.

I gave you an impedance that fits that description. Show us how
to make it better.

You dance around questions more than a politician.

Nightwatch Smitewatch--all are Chinese JUNK! Especially JUNK is the 75wx or any other unit like the HH-70. I have some 70LTD's left. They are the older, GOOD ones! E mail me if interested. Also have some NOS Hy-gain 9's left and used ones--the 1st hidden type ever made. They made the 40 channel as 50 channel units!

Actually these units are NOT called "Hand Held." Call them "everything in the Mic" units. Hand held refers to Walki Talkies or walk around units. These units above are controls in the mic, and the CB is in a box hooked to it. But the newer units ARE JUNK because nothing much is in the box and EVERYTHING is in the mic--coax and all! Coax goes down IN the mic cord ! JUNK JUNK JUNK !! The older units (67, 70 LTD's are a LOT bettter!!!!!!!!!!
Dave!!!!!!!!!!!!

Excuse me Mr. Davis,

I only would have ignored you if you hurled an obscenity or an insult. Otherwise, I try my best to answer any and all questions that people have for me.

One thing bugs me though about your response.

You imply that it's normal to "talk over" CB conversations of people you don't like. As if RF power solves everything. That, sir, is rude. And ignorant. 11 meters (as it was conceived by the FCC) is a party line, a shared resource, a cooperative public property. No one has the right to take over this resource so that others can't use it.

I am also disturbed by your inference that 5 watt stations are somehow inferior and shameful. You make it sound nerdy and stupid to be running a legal CB station. As if more power makes you a more serious radio hobbyist. It does not. Just ask Mr.137 (who has the courage to operate legally).

Lastly, the real Miles Davis is an artist who's musical innovations are shared with the world. His music brings pleasure to others. Its purpose is not to intimidate or take advantage.

Shame on you for being a bully and an elitist, sir.

Most sincerely,
Aaron H. Voobner

Just out of curiosity I wired one up yesterday. I used two 10 inch pieces of RG-8 for the 25 ohm section and 30 inches of the same to the antenna. It works fine with a roof-mounted 9' whip (no, I don't drive with that one attached), and gave a 1:1.1 SWR at the radio with three different lengths of feedline. Field strength was the same as with the L-match.

It works so well that I am going to make that permanent on my mobile, and do a bit of testing with other antennas.

>Show us your quick calcs.

I used hamcalc. Good program.

Let me explain it to you as I, a CB shop of 21 years+ sees it. "Swing" isn't some kind of redneck music from some by-gone Hippy era, but it is the result of dummies putting modulation kits in (the VERY WORST CB shops in the land put them in) which make the CB's TOO LOUD because the power is put too LOW (I know yo hambos will love this). The problem is that these young WHIPPER SNAPPER CB shop DUMMIES is they actually believe and think that this OVER modulation will get them out FURTHER than more output power! Ain't dey DUMB?! Dey IS da most dumb!
So you got thousands of these DUMMIES doing this all over da land, while you have the few GOOD places taking them out to restore MORE range and sanity! So you monkeys QUIT swinging from dem trees, and come back to the real world. Swing will only get you far in tarzan's world. Dem BIG Power bros & boys know dat it's da POWER that does it, NOT da modgulasion!!!!!

The following items are on Clearance sale and therefore not returnable. They are however, NEW in package or box. They are priced as shown.

4 - CB/10 Meter Base Station Antennas. Listed for $79.95. Their successor models list for $69.95

These are being sold for $60.00 (shipped). You save at least $10!

3 - 12 VDC 3 Amp rated Cigarette Lighter adapters with on/off switch. $3.00 - shipping extra.

1 set of CB - 3 channel 2 watt walkie talkies good for Camping or traveling come equipped with Channel 14. Regularly $39.99. Sell for $30 each or pair for $50.00

PA residents, must pay 6% tax.

We have other items available, including CB sets and so on. Pics available via e-mail.
Year end clearance. Lots of goodies!

Orders paid by Postal Money Order ship same day except Saturdays.
Checks must clear the bank. Sorry, but we do not accept Credit Cards nor store bought Money Orders.

I get at least one person a month that comes back after a fix and
says, "The needle doesn't move anymore. What's wrong?" I don't think
they really care if anyone can understand their audio (not that it is
intelligible anyway), they just like to see the little needle move.

THOU Shall NOT STEAL !!!!!!

Actually, if he was black, then RACE was definately an issue. If he was jewish, then it was Antie Shemetic. If he was a honkey, then he was a bad cracker head!
Actually it may be easy to find out who murdered the thief. Ups records on what came in, or if it is like some of these CB shops that I've heard of that were DESTROYED, or like what W. Memphis Ch. 5 is doing to people, it may be that they ripped off SO MANY that anyone ripped off could of done it (thousands). Too bad mommy didn't save him (she could of IF he was taught right) for violating The Father's LAW !!!!! 10 Commandment violation!!! Dave!!!!!!!

<aaronvoobner@my-deja.com> wrote in message news:92k3o4$qo5$1@nnrp1.deja.com...
Did some research. This newsgroup has a long and infamous past. Excerpts from a 1998 WIRED magazine article.

Enjoy,
Aaron Voobner

Chris Marquis was a 17-year-old Vermont hustler running a small-time scam online. His virtual business was going great - until somebody killed him.

By Scott Kirsner, WIRED MAGAZINE

On the afternoon of March 19, 1998, a UPS driver named Armand Gevry delivered a cardboard box to the pea-green house at 3 Washington Street in Fair Haven, Vermont. Gevry lives two blocks away, and when Sheila Rockwell opened the door, she recognized him as the deliveryman who often brought shipments of citizen's band radio equipment to her son. It was a cold, gray day outside - light snow changing to sleet changing to rain - so she quickly took the package from Gevry, thanked him, and shut the door. Rockwell, a weathered woman of 52 with hard blue eyes and wispy brown hair, carried the box down the hallway of her modest home. Chris Marquis was talking on his new Ranger RCI 2990 radio with his girlfriend, Cyndi McDonald, when his mother brought the package into his wood-paneled bedroom. His 6-foot frame was hunched over the microphone on his desk, his dirty-blond hair was swept forward across his forehead, and a thin mustache fuzzed his upper lip.

Rockwell handed the 2-foot-long box to her son. She didn't recognize the return address, so she sat down on Chris's bed, curious to see what was inside.

Chris continued chatting with Cyndi. The name and address on the box - Samantha Brown, 1863 South High Street, Bucyrus, Ohio - didn't ring any bells for him either.

"I got a package in the mail," Chris told Cyndi. He'd met her two years earlier as a quiet, sweet voice on Channel 1. Cyndi was now in the 11th grade, a year ahead of Chris, but she attended school in Whitehall, the next town over. Their favorite date was a meal at the McDonald's on the far edge of Fair Haven.
"What is it?" Cyndi asked. "Who's it from?"
"Hold on. I don't know," Chris answered, as he grabbed his jackknife from the holster on his belt and slit the box open. Inside was a slightly smaller box made of styrofoam.
"Well, it's probably a bomb, then," Cyndi joked.
The explosion knocked Chris and his mother to the floor.

"Chris had a message up," Sischo, who lives in Michigan, recalls. "It said, 'Anybody looking to buy, sell, or trade radio equipment, email me.' I had some stuff that I couldn't sell around here, so I was gonna do a trade." After corresponding by email, Chris taught Sischo how to use Mirabilis's ICQ software so they could chat in real time. They discussed the relative merits of Rangers and Unidens and Cherokees and Cobras. Chris, who used "Psycho" as his email name and CB handle and dubbed himself "PhantomOp" on ICQ, revealed his real name to Sischo. He also griped about his wife, sent a digitized picture of his daughter by email, and pointed Sischo to a Web page he'd set up to advertise the CB Shack.

Eventually, the two began trying to work out a trade. They agreed that Chris would send Sischo a Galaxy Saturn Turbo worth about $700, a couple other radios, and a few microphones and accessories. In return, Sischo would send three radios and microphones to Chris. Since the gear that Sischo was sending Chris was of lesser value, he also included a check for $100.

After exchanging tracking numbers with Chris so each could verify that the other had, indeed, sent the equipment, Sischo shipped his box by UPS in early March. But when Sischo visited the UPS Web site and punched in the 18 digits Chris had given him, he got the message "Unable to track shipment." He checked the number and tried again. Same thing.
Certain that Chris had intended to con him, Sischo called UPS and stopped delivery. He spoke to a representative of the company's security department, who asked whether Sischo knew anyone else who'd been burned by Chris Marquis. Sischo said he didn't but promised to see whether he could find others.

Sischo began posting messages around the Web and on Usenet groups. "Everyone who has been ripped off by Chris Marquis Email me immediately!!" he wrote to the readers of rec.radio.cb on March 14. The responses came quickly. Sischo heard from three or four people who had lost radios and money to the "proprietor" of the nonexistent CB Shack. One of them was NCTomCat, an America Online user who reported that he'd sent $25 to Chris to cover the shipping costs of a radio that never

arrived.

In addition to emailing Sischo, TomCat was posting threatening messages on rec.radio.cb. "He ripped me off too," TomCat wrote on March 16. "I am posting ads about that crook all over the internet... the address I have is Washington St. Fairhaven Vermont... DONT MAIL THIS LIAR ANY MONEY OR YOU WILL BE POORER BUT WISER!!!!!! If I can find someone to pay the 2 way airfare, I will go there and collect everyones money back, and give him some severe dental problems to deal with... Are You listening Chris?? When You see a 6 foot 5 inch dark haired man at Your door, You better duck 'cause I will be about to drop the maul... on You noggin dude......."

On the rec.radio.cb newsgroup, TomCat insisted he "was mad but not a killer." He liked to hunt, according to Don Chilson, pastor at Pierceton's Bethel Baptist Church and a golfing buddy of Dean's, and he took tae kwan do lessons at an academy next to the grocery store in Pierceton. He'd also recently configured his computer to access the Net.

It was online that Dean first encountered Chris Marquis, according to Gonzo. Chris had confided in his friend about his dealings with Dean. He'd told Gonzo about a fantastic trade he'd negotiated with a guy in Indiana: a Ranger RCI 2990 in return for a Cobra 2000 CB radio. The RCI, a sleek, rack-mountable black box, was a 10-meter amateur radio that had been modified to handle CB transmissions. Another hack enabled the radio's user to "freeband" - go outside of the 40 channels the FCC allocates for CB transmissions. A compression board had been installed to boost speech levels. "It was the loudest thing on the air," says Gonzo, who estimates that all the enhancements bumped the radio's value up to nearly $800.

What was strange about the trade was that a Cobra 2000 is worth only about $400. It's an older radio - all brushed steel and simulated wood grain - an emblem of CB's 1970s heyday, when Smokey and the Bandit and C. W. McCall's populist trucker anthem "Convoy" made the once-obscure hobby suddenly hot. Gonzo was puzzled; why would someone trade a radio worth $800 for one worth half as much?

When he visited Chris, Gonzo saw the 2990 Dean had sent. Then Chris told him that instead of sending Dean the Cobra 2000 he'd promised, he had shipped a Realistic mobile radio that didn't even work just so Dean would have a tracking number as the two shipments crossed in the mail. (Apparently, Chris had learned a lesson from the deal with Sischo.) As soon as Dean had gotten the junk radio, he'd started making threatening calls and sending hostile email. In one message Dean said he was coming to Vermont to sort things out.

As Gonzo recalls it, as soon as he and Chris were alone, the teenager confessed to worrying that Dean would show up at his door. Dean had just called again, he told Gonzo, but his mother had covered for him. He asked what he should do; Gonzo advised him to give the radio back. But a short while later Chris was upbeat again. Gonzo noticed that the boy

always felt sure his mother could protect him from any real harm. Indeed, when Dean had called that day, Rockwell had blithely told him her son wasn't in Vermont - she said he had been thrown in jail in another state.

Maybe Chris Marquis never understood that his actions could have consequences. Perhaps he thought his online identities would somehow shield him from real-world harm. He was Psycho, or Taz, or PhantomOp. He was also proprietor of the CB Shack, 27 years old, married. If no one could figure out exactly who he was, then how could they get to him? His fluid sense of identity may have made him feel invulnerable.

Even when people like Mark Sischo and Chris Dean began closing in on the real Chris Marquis, the teenager still felt he was in control. When Sischo began sounding the alarm on rec.radio.cb and the RCI Federation site after he'd been burned by Chris, the youth had countered with a message of his own. Sischo was simply upset, Chris explained, because the CB Shack wouldn't sell him a radio he wanted badly. Even when an angry Dean started calling, started threatening to come to Vermont, the teen never felt he was in serious danger. If all else failed, his mother would handle it for him.

And what of the man authorities say murdered him? If the criminal charges are true, Dean made and mailed a bomb, taking no other precaution than making up a name, Samantha Brown, the girl from Bucyrus, Ohio, from whom no one would expect to receive such a nasty surprise. Maybe it was easier to imagine killing someone he had never met. He tangled with Chris on the phone, by email, and over ICQ. But he never saw the teenager's face. Maybe his fluid sense of identity also made him feel invulnerable. Catch me if you can.

Do some math. If your carrier is 2 watts and your modulation brings it
up to 8 watts, what is your percent of modulation? Over 100%. What
happens with >100% modulation? Distortion. Of course it will sound
louder. It will sound louder all over the band and in the neighbor's
TV. You can even keydown on Monday Night Football.

Pantell....

George,

Since YOU are the party that made the request to meet some Voobners, it is only polite that you offer to pay for their lunch. Also, you seriously can't expect me to expose my elderly aunt and uncle to potential discomfort or embarassment.

Therefore, I should be the one to dictate the actual terms of the meeting. And my terms are that you must provide a name, address, and telephone number (preferably in the the St. Mary's County area) by which an initial interview can be conducted with you before any face-to-face meeting takes place. Also you will be asked to fax a valid driver license or US Passport number for purposes of ID.

Or else there'll be no Voobners. Not one. You'll be Voobner-less. Your whole world will turn all white and crumbly. Think about it. You'd have come so far - and then failed. You wouldn't want that, would you, George? Of course not.

Act quickly and soon you could soon be lunching with bonafide relatives of the Voobner family, looking at photos of me, chatting about me, etc.

Sincerely,
Aaron H. Voobner

Exactly and that is what the swing mods accomplish plus introduce distortion and splatter. But then to many cbers don't care about clear communications, just being loud and watching meters swing.

Immoral RAT:
HEY MORON--The BEST CB shops in the country AGREE with me, and a guy I know that has been doing it for 41 years too! I am NOT stupid--I just make the observation taht TRUCK DRIVERS say that they don't get out AS FAR as they did before with the mod kit in.

The CB does 5-6 watts tuned up and goes 1 more watt. 4 watts doesn't modulate to 8 RMS. BONE HEAD--2 may modulate RMS to 4 or 5, but NOT 6. When the watts are higher, it goes further. YOUR thinking and application is WRONG! I have been a CB field tech in big trucks for over 4 years solid now, and the evidence is in: I and the BEST CB Shops in the Land are NOT STUPID---YOU ARE most dumb for believing this nonsence!!!! AND it isn't trhe OVER LOUDNESS that matters, my 6 watt dead key goes over your 2 watt I don't care what it "swings" up to. Plus it is NOT distorted and sounds GOOD. No one having to lower their volume control to listen to my tune ups, but YOU IDIOTS are BABIES crying & making TOO MUCH SPLATTER AND UN-INTELLAGABILITY !!!!!!!! REPENT LOUD DUMMIES ~!!~!!!!!!! For YOU are 1 of the WORST CB Shops in da LAND !!!!!
Dave!!!!!!!!!!!!!!!!!

The jurisdiction of the FCC is within the US and it's territories only. Illegal operation in other countries must be handled by that specific country. There is a world union that has little or no power exect by treaty agreements signed by member countries. Making ooperation legal in a foriegn country by no means makes it legal here. For many years England could hear US amature communications on 50 to 54 Mhz frequency band. They could not talk to the US because they had no priviledges. England had 72Mhz priviledges while we do not. Unfortunantly RF does not respect the borders created by man.

Yep! The forces of good have stepped into this outhouse to do battle with the dark side of the force.
The MIGHTY N8wwm has slain a shithouse fulla dragons...And still they stupidly attempt to bug me. No way, Keyclowns. These guys are, when taken collectively, a damn good arguement for selective breeding. Of course, that is because they very likely "selected" blood relatives.

What? 20 year old Technology? You must of not bought a hi-tech CB in
86-'87 when Uniden made those units that receive better. Or you must of not
bought a NEW PC-68 or 78 with the Dynamic Squelch Control. Sounds like yo
need to spend a few $$$ & get one. Can I sell you one?

We will just have to MAKE this NewsGroup better. We good CB'ers will have
to put more GOOD posts on, and no one will look @ da trash!!! Wouldn't it
be wild if we had this Pooter stuff & Newsgroup in '77?
Dave!!!!!!!

I am a trucker and run I-80 from Pa into NYC everyday.
Very often we all here a guy who calls himself "the governor of
Pennsylvania.
The guy is on ch 19 and ata base station that blows out every radio about
halfway into New Jersey.
Mostly he comes on at night and tries to piss off every trucker out
there. Guess he doesnt date much.
Anyone else here been annoyed by this guy?

Can I buy 1 of deez trollmeters?

A "Shootout" is when a bunch of Bros and a few Honkeys git together in a park or Wally's World parking lot when empty. Dey put 1 CB receiver in one end of da lot, and put da "Key Downers" in da other end of it. Da Key Downers Key down, and who ever da receiver hears wins da shootout. Now I've never been to one, but dey explains it to me dat way. I guess a lot of BIG power Honkey Crackers go there too! I'm sure dem modulation kit radios git blown away there too!!!!!
